EDR Inquiry # 4339741.1

Contact: John Gondek

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by GEI Consultants Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

GRAVEL & SAND		SILT & CLAY	
VERY LOOSE	0-4	SOFT	4 OR LESS
LOOSE	5-10	MEDIUM	5 TO 8
MEDIUM	11-30	STIFF	9 TO 16
DENSE	31-50	VERY STIFF	17 TO 32
VERY DENSE	OVER 50	HARD	OVER 32

SOIL DESCRIPTIONS ARE BY VISUAL EXAMINATION OF SOIL SAMPLES RECOVERED DURING DRILLING OPERATIONS
SOIL DESCRIPTIONS ARE IN ACCORD WITH THE UNIFIED SOILS CLASSIFICATION SYSTEM AND
NYC BUILDING CODE SUBCHAPTER 11, ARTICLE 4
ALL BORING ELEVATIONS ARE REFERENCED TO EXISTING GROUND LEVEL AS ZERO ELEVATION.

"N" STANDARD PENETRATION TEST (2" SPOON, 140lb HAMMER, 30" FALL)

3 9 / 12 5 — N = 21 BLOWS PER FOOT

SPOON BLOW COUNT IS GENERALLY SHOWN IN 6" INCREMENTS FOR 2' DRIVE. TO OBTAIN BLOWS PER FOOT (N) USE THE 2nd & 3rd 6" INCREMENT.

SOIL SAMPLES AND FIELD REPORTS WILL BE DISCARDED AFTER SIX MONTHS
THIS REPORT IS SUBMITTED WITH THE SPECIFIC UNDERSTANDING THAT THE SOLE LIABILITY OF BIG APPLE TESTING, INC., ITS ENGINEERS AND EMPLOYEES FOR ERRORS AND OMISSIONS IS LIMITED TO THE AMOUNT OF THE FEE PAID FOR THIS REPORT. THE USE OF THIS REPORT WILL CONSTITUTE AN ACCEPTANCE BY THE CLIENT OF THIS DISCLAIMER. THE FEE CHARGED FOR THIS REPORT IS PREDICTED UPON THIS LIMITATION OF LIABILITY WHICH IS THE ESSENCE OF THIS AGREEMENT. IF THESE TERMS ARE NOT ACCEPTABLE, CLIENT MUST NOTIFY BAT, INC. IN WRITING BY CERTIFY MAIL, RETURN RECEIPT REQUESTED WITHIN FIVE (5) DAYS. BIG APPLE TESTING, INC., ITS ENGINEERS AND EMPLOYEES DO NOT ACCEPT ANY LIABILITY OR RESPONSIBILITY FOR PERSONS OTHER THAN THE CLIENT FOR WHOM THIS WORK WAS DIRECTLY PREPARED AND ANY SUCH PERSON, FIRM OR CORPORATION RELIES ON THIS REPORT AT HIS OWN RISK.

BORING CONTRACTOR'S CERTIFICATION

BIG APPLE TESTING, INC. CERTIFIES AS TO THE ACCURACY OF THE SPOON AND CASING BLOWS AND ELEVATIONS AND METHOD OF BORING.

THE FOLLOWING EQUIPMENT WAS USED:

Re: Phase I Environmental Site Assessment
254 Maspeth Avenue
Brooklyn, New York 11211

Dear Mr. Hillcoat:

Enclosed are two copies of the Phase I Environmental Site Assessment report for the 254 Maspeth Avenue property. Based on the Phase I ESA performed on the property, the following recognized environmental condition (REC) was identified:

- Surficial soil staining was observed on-site during the site inspection. The stained soil is considered a REC.

Gannett Fleming recommends that a Phase II investigation be performed to investigate potential soil and groundwater contamination due to the soil staining at the subject property.

The following sites present a *de minimis* environmental concern, and are not considered RECs but have the potential to impact the subject property by groundwater migration of off-site contamination. However, the shallow groundwater underlying the subject property has no known potable or other use.

- Six upgradient LTANK sites are listed as tank test failures or tank overfills. These sites lack a NYSDEC closure date.

- Review of the historical sanborn fire insurance maps revealed that the subject property and surrounding properties have a history as being utilized for manufacturing and industrial usage.

Re: Phase II Environmental Site Investigation
252 Maspeth Avenue
Brooklyn, New York 11211

Dear Mr. Hillcoat:

The purpose of this Environmental Site Investigation is to establish a baseline of potential subsurface contaminants present on-site due to historical use of the property. The scope of work was based upon review of historical information of the surrounding properties, visual inspection of the site and consisted of advancing soil borings, collecting and analyzing soil and groundwater samples. The following letter report summarizes the finding and conclusions based on the activities performed on March 28, 2005 at the subject property, located at 252 Maspeth Avenue, in Brooklyn, NY (Site). A Site Plan with boring locations is provided as Figure 1.

Site Background

GF reviewed historical Sanborn maps and determined that the Site and surrounding area had been used as part of the Brooklyn Union Gas facility from about 1907 through 1965. The Site was noted to operate as a storage facility on the 1968 through 1995 maps. However, the type of storage is not mentioned on any of the maps. The Site was recently used as a solid waste transfer station (Fontana Transfer Station) and is currently vacant. Structures observed on the property include a small vacant office shed, 7 empty roll-off containers, and pieces of large machinery.

Inferred groundwater flow is southerly, discharging into the English Kills. Relative to groundwater flow, boring B-1 was selected as the up-gradient location and boring B-4 as the down-gradient location. Soil boring locations were selected to establish general subsurface conditions on-site and were also contingent upon on-site utility clearance, heavy machinery, and/or equipment storage.

Environmental Site Investigation

Borehole Advancement and Soil Sampling

The use of Geoprobe® technology for soil boring advancement was not considered after reviewing investigative reports performed on surrounding properties. Attempted areas of soil

Continued . . .

boring advancements in the adjacent property encountered refusal reportedly due to the presence of heavy timbers.

On March 28, 2005, Tri-State Drilling advanced four borings (B-1 through B-4) to total depths of approximately 10 to 12 feet below grade surface using a truck mounted Mobil B-57 hollow stem auger drill rig. Groundwater was encountered approximately seven to nine feet below grade. Soil samples were collected from depth interval that demonstrated the most contamination or from the soil interval immediately above the groundwater interface. This was accomplished with the aid of a steel split-spoon core barrel and a 140-pound, down-hole hammer. Prior to sampling, each split-spoon core barrel sampler was opened and Gannett Fleming personnel recorded lithology and field screened soil samples for organic vapors using a photo-ionization detector (PID). The PID readings are summarized in the geologic boring logs provided as Appendix A.

A composite soil sample was made from multiple two-foot intervals due to limited recovery of soil in the split-spoon core barrel sampler. Soil samples were collected and placed in laboratory-supplied glassware, packed in ice, shipped to EcoTest Laboratories and analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) polyaromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), and 13 Priority Pollutant Metals plus Barium.

Boring B-1
Odors and stains were observed in the samples collected at boring B-1. PID readings varied from 3.5 parts per million (ppm) at the 7-9 foot interval to 5.5 ppm at the 3-5 foot interval. A composite soil sample was obtained from 3 to 7 feet below grade based on the higher PID reading and groundwater encountered at approximately 7 feet below grade.

Boring B-2
Odors and stains were observed in the samples collected at boring B-2. PID readings varied from 0.0 ppm at the 0-2 foot and 8-10 foot intervals to 2.0 ppm at the 2-4 foot interval. A composite soil sample was obtained from 4 to 8 feet below grade based on the PID readings and groundwater encountered at approximately 7.5 feet below grade.

Boring B-3
Odors and stains were observed in the samples collected at boring B-3. PID readings varied from 0.0 ppm at the 0-2 foot and 4-6 foot intervals to 1.3 ppm at the 6-8 foot interval. A composite soil sample was obtained from 2 to 8 feet below grade based on the PID readings and groundwater encountered at approximately 8 feet below grade.

Boring B-4
Odors and stains were observed in the samples collected at boring B-4. PID readings varied from 0.0 ppm at the 0-2 foot, 6-8 foot, and 8-10 foot intervals to 2.5 ppm at the 2-4 foot interval. A composite soil sample was obtained from 2 to 6 feet below grade based on the PID readings.

Continued . . .

Groundwater Sampling

Tri-State Drillers installed new temporary PVC well casing within borings B-1 and B-4 to a depth of approximately 12 feet below grade. The well casing was screened the entire depth to ensure that a representative groundwater sample could be obtained. GF manually collected one groundwater sample from each of these two temporary monitoring wells using dedicated tubing equipped with a check value.

Groundwater samples were placed in laboratory-supplied glassware, packed in ice and shipped to EcoTest Laboratories and analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polyaromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), and 13 Priority pollutant metals plus barium.

Findings

Soil

Soil analytical results were compared to the NYSDEC *Technical and Administrative Guidance Memorandum* (TAGM) *4046: Determination of Soil Cleanup Objectives and Levels.*

- VOCs – Several VOCs were detected in each of the four soil samples at concentrations below the NYSDEC TAGM , however; concentrations did not exceed NYSDEC Recommended Soil Cleanup Objectives (RSCOs) with the following exceptions:
  - naphthalene was reported within the soil sample from boring B-3 at a value of 40,000 ppb exceeding the RSCO of 1300 ppb;
  - M+P xylene was reported within the soil sample from boring B-4 at a value of 1300 ppb exceeding the RSCO of 1200 ppb.

- SVOCs – The analyzed list of SVOCs were detected in all four soil samples with the exception of acenapthylene within each of the four soil samples and 2-methylnapthalene within borings B-1 and B-2. Concentrations of the detected SVOCs varied with reported values below the laboratory methodology's minimal detection limit (MDL) to above the RSCO values.

- PCBs were not detected in the four analyzed soil samples with the exception of Aroclor 1254 which was reported at concentrations below the NYSDEC TAGM RSCO level of 10,000 ppb.

- Heavy metals – The analyzed list of heavy metals were detected in each of the four analyzed soil samples with the exceptions of antimony, selenium, and thallium which were reported as non-detected in each sample. Concentrations varied with the

Continued . . .

compounds from below the laboratory methodology's MDL to above the RSCO. Beryllium, copper, and zinc exceeded the RSCO in all four samples analyzed. Barium, cadmium, chromium, nickel, and silver were not detected or were detected at concentrations below the RSCO or site background (SB). Lead was detected in the soil samples from all four borings and exceeded the RSCO of 500 ppm at B-3 with a concentration of 700 ppm. Mercury was detected in the soil samples from all four borings and exceeded the RSCO of 0.1 ppm at boring B-1 with a concentration of 0.16 ppm and at boring B-3 with a concentration of 0.34 ppm. Arsenic was detected in the soil samples from all four borings and exceeded the RSCO of 7.5 ppm and SB of 3-12 ppm at B-3 with a concentration of 46 ppm.

Soil analytical results are summarized in Tables 1 through 4 and laboratory analytical data sheets are provided as Appendix B.

Groundwater

Groundwater analytical results were compared to NYSDEC Technical and Operational Guidance Series guidance values (TOGS).

- VOCs – Acetone and naphthalene were detected within the groundwater sample at B-1 (GW) below the NYSDEC TOGS guidance value. Benzene was detected in the groundwater sample collected from at B-1 (GW) with a concentration of 1 ppb which slightly exceedd the NYSDEC TOGS value of 0.7ppb. 1,2,4 trimethylbenzene, acetone, ethyl benzene, o-xylene, p-isopropyltoluene, and toluene were detected in the groundwater sample from B-4 (GW) below the NYSDEC TOGS values. M+p xylene and naphthalene were detected in the groundwater sample from B-4 (GW) at a concentration of 7.0 ppb and 84 ppb, respectively, exceeding the respective TOGS guidance values of 5.0 ppb and 10.0 ppb. No other VOCs were detected.

- SVOCs – Acenapthene was detected in the groundwater sample from B-1 (GW), and phenanthrene and pyrene were detected in the groundwater sample from B-4 (GW) below the NYSDEC TOGS values. Naphthalene was detected within the groundwater sample at B-4 (GW) at a concentration of 13 ppb slightly exceeding the NYSDEC TOGS guidance value of 10 ppb. No other SVOCs were detected.

- PCBs were not detected in the groundwater sample collected at B-1(GW) or B-4 (GW) with the exception of Aroclor 1260 which was detected in the groundwater sample collected from B-4(GW) at a concentration of 0.09 ppb slightly exceeding the NYSDEC TOGS guidance value of 2.0 ppb.

- Heavy metals were detected in the groundwater samples collected with the exception of antimony, silver, and thallium. Arsenic, barium, beryllium, cadmium, chromium, cooper, lead, mercury, nickel, selenium, and zinc exceeded the NYSDEC TOGS

Continued . . .

- guidance values within the groundwater sample at B-1 (GW). Beryllium and cadmium were not detected at B-4 (GW). However, arsenic, barium, chromium, copper, lead, mercury, nickel, selenium, and zinc exceeded the NYSDEC TOGS guidance values at B-4 (GW).

Groundwater analytical results are summarized in Tables 5 through 8 and laboratory analytical data sheets are provided as Appendix B.

Conclusions

The findings of this site investigation will be used to establish a quality baseline of subsurface conditions on-site prior to Cooper Tank and Welding Inc. obtaining a lease for the Property. The findings of this investigation indicate that the subsurface soil has been impacted potentially by historical site operations and several soil quality parameters exceed the NYSDEC cleanup objectives.

Soil and groundwater quality found on-site are a generalized representation of the historical and industrial use of the property. Several groundwater quality parameters exceed NYSDEC guidance values, however, it was not within this scope of work to determine if historical site activities contributed to this impact. Soil handling and excavation will require proper handling, transport, and disposal procedures as well as proper health and safety protocol. Any direct contact with the groundwater appears remote at present, however, should dewatering activities be planned proper handling, disposal, treatment, health and safety protocol will be required.

If you have any questions or require additional information, please feel free to contact the undersigned.

Very truly yours,

1.0 INTRODUCTION

1.1 Executive Summary of Findings

Cooper Tank and Welding Corp. retained Gannett Fleming Engineers, P.C. (Gannett Fleming) to conduct a Phase I Environmental Site Assessment (ESA) of the property located at 254 Maspeth Avenue, Brooklyn, New York. The site assessment was performed to evaluate environmental conditions on the property associated with historical property use and current operations to satisfy the requirements of the *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (ASTM Designation E1527-00).*

The property consists of an unimproved vacant fenced lot with an exposed bare soil surface. Overgrown vegetation surrounds a majority of the lot. The property is situated in a predominantly industrial/commercial area of Brooklyn, New York. The surrounding properties include a former Brooklyn Union Gas tank yard, industrial properties to the west, and warehouses to the east and south.

The subject property is not identified in any of the Federal or State databases.

Based on the Phase I ESA performed for the property, the following recognized environmental condition (REC) was identified:

- Surficial soil staining was observed on-site during the site inspection.

The following sites present a *de minimis* environmental concern, and are not considered RECs but have the potential to impact the subject property by groundwater migration of off-site contamination. However, the shallow groundwater underlying the subject property has no known potable or other use.

- Six upgradient LTANK sites are listed as tank test failures or tank overfills. These sites lack a NYSDEC closure date.

- Review of the historical sanborn fire insurance maps revealed that the subject property and surrounding properties have a history as being utilized for manufacturing and industrial usage.

No Non-ASTM related building issues were observed.

1.2 Purpose

Cooper Tank and Welding Corp. retained Gannett Fleming on October 12, 2004 to conduct a Phase I Environmental Site Assessment (ESA) of the property located at 254 Maspeth Avenue, Brooklyn, New York in accordance with ASTM E1527-00 protocol. The purpose of this Phase I ESA is to provide Cooper Tank and Welding Corp. with a description of any *recognized environmental conditions* (RECs) on the property.

As defined in ASTM E 1527-00, "the term *recognized environmental conditions* is defined as the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property". The term *recognized environmental conditions* does not include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

1.3 Involved Parties

The involved parties concerned with this report include the potential buyer and current owner of the subject property.

- Cooper Tank Welding Corp.,
- Spencer (1997) Investment Limited Partnership, and
- Bank of America

1.4 Scope of Work

The Phase I ESA tasks included a site reconnaissance, interviews, computer database search of environmental compliance records, and review of historical information. Environmental Data Resources, Inc. (EDR) of Southport, Connecticut conducted the database search in accordance with ASTM search distances.

Freedom of Information Act (FOIA) requests were sent to federal, state, and local regulatory agencies to determine the regulatory status of the property.

In order for the client to quantify the level of acceptable *business environmental risk* associated with this commercial real estate transaction, several non-ASTM scope items were considered. These consist of:

- Asbestos-containing materials;
- Radon;
- Lead-Based Paint; and
- Wetlands

The additional assessment was limited in nature consisting to a visual inspection and EDR report review.

printed on recycled paper

2.0 GENERAL SITE CHARACTERISTICS

2.1 Property Location

The subject property is located at 254 Maspeth Avenue, Brooklyn, New York. The subject property is located in the USGS 7.5 minute quadrangle of Brooklyn, New York.

The property is located on the south side of Maspeth Avenue east of Vandervoort Avenue.

A site location map is presented in Figure 1.

2.2 Current Uses of Adjoining Properties

Maspeth Avenue and a former Brooklyn Union Gas tank yard bounds the Property to the north, a transfer station is located to the west, and warehouses to the south and east of the property.

2.3 Site Description and Current Site Uses of the Property/Operations

The subject property is currently occupied by Galasso Trucking Inc. and is used as a temporary storage lot for large machinery, roll-off trucks, HVAC units, refrigeration units, and a bulk petroleum storage tank.

The property is located in Kings County in a predominantly industrial/commercial area.

The subject property consists of an enclosed lot with an exposed bare soil surface.

3.0 ENVIRONMENTAL SETTING

3.1 Regional Physiographic Conditions

The subject property is approximately 14 feet above mean sea level. The general topographic and assumed hydraulic gradient at the property is to the southeast towards English Kills, which ultimately discharges to the East River.

No wetlands, surface water bodies, or other ecologically sensitive areas were identified on the subject property during the site reconnaissance.

3.2 Soil Conditions

Surficial soils in the area are generally loamy sands, silty loams, sandy loams and fine sandy loams.

Soil conditions typically underlying the industrial Brooklyn area surrounding the subject property are typically composed of fill materials. These fill materials generally consist of a heterogeneous mix of brick, wood chips, and asphalt. These materials generally have a higher level of contamination levels than a residential area would contain and may include poly aromatic hydrocarbons (PAH's).

3.3 Geologic Conditions

The subject Property is located in Kings County on western Long Island. In general the Property is underlain by a sequence Pleistocene and Cretaceous aged unconsolidated glacial deposits including sands, gravels, clays and silts. Of the four aquifers existing on Long Island only the Upper Glacial (water table) aquifer is evident at the subject Property. It consists of tills, outwash, glaciolacustrine, and marine deposits. This aquifer is in turn underlain by the

Pleistocene Gardiners Clay consisting of clays and silts and layers of sand and gravel. Bedrock is encountered at approximately 100 feet and is composed of crystalline metamorphic and igneous rocks consisting of muscovites, biotite schists, gneisses and granites and is found lying in a southeastward slope.

Site-specific groundwater depth and flow direction can only be determined by a focused hydrogeologic study, which is beyond the scope of this Phase I site assessment. However, groundwater in this area is cited to be at a depth of approximately 9 to 12 feet below grade based on information from United States Geological Survey (USGS) Fact Sheet #134-97 and the approximate site elevation provided by EDR.

printed on recycled paper

4.0 RESULTS OF INVESTIGATION

4.1 Site Inspection Observations

Gannett Fleming representative Ivy Hidalgo-Olberding performed the property reconnaissance on October 14, 2004.

The subject property is currently utilized as a temporary storage lot for large machinery, roll-off trucks, HVAC units, refrigeration units, and a bulk petroleum storage tank.

4.2 Description of Structures, Roads, and Other Improvements on the Site

The lot is L shaped with an exposed bare soil surface. No improvements were observed during the site inspection.

No evidence of hazardous waste handling or disposal was observed during the site reconnaissance.

No evidence of poly-chlorinated biphenyls (PCB) containing materials such as transformers were identified during the site reconnaissance.

Site photographs of the property are presented in Appendix A.

4.3 Adjacent Site and Vicinity Observations

The surrounding properties include a former Brooklyn Union Gas tank yard located to the north of the property. A transfer station is located to the west, and industrial/commercial properties occupy the buildings to the west, and warehouses to the south.

printed on recycled paper

4.4 Results of Regulatory Agency List Review and File Research

The subject property is not listed in any of the federal or state databases.

Regulatory Database Review

Environmental Data Resources, Inc. (EDR) of Southport, Connecticut was retained to provide a computerized database search of the project area in accordance with ASTM E1527-00 standards for search distance and accuracy. The EDR database search is included in Appendix B. The database output was reviewed to determine if the site appears on the following lists:

Federal List

- National Priorities List (Superfund)
- Proposed NPL
- Comprehensive Environmental Response Compensation & Liability
- Information System (CERCLIS)
- CERCLIS – No Further Remedial Action Planned (CERCLIS-NFRAP)
- Resource Conservation and Recovery Act (RCRA) Treatment, Storage and Disposal (TSD)
- RCRA Small and Large Quantity Hazardous Waste Generators (SQG, LQG)
- RCRA Corrective Action Activity (CORRACTS)
- Emergency Response Notification System (ERNS)
- Facility Index System (FINDS)
- Material Licensing Tracking System (MLTS)
- Superfund (CERCLA) Consent Decrees (CONSENT)
- Record of Decision (ROD)
- National Priorities List Deletions (Delisted NPL)
- Hazardous Materials Information Reporting System (HMIRS)
- Mines Master Index Files (MINES)
- Federal Superfund Liens (NPL Liens)
- PCB Activity Database System (PADS)

- Lisiting of Brownfields Sites (US BROWNFIELDS)
- Listing of Indian Reservations (INDIAN RESERV)
- Uranium Mill Tailing Sites (UMTRA)
- Department of Defense Sites (DOD)
- RCRA Administrative Action Tracking System (RAATS)
- Toxic Chemical Release Inventory System (TRIS)
- Toxic Substance Control Act (TSCA)
- Section Seven Tracking Systems (SSTS)
- Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA)/ Toxic Substances
- Control Act (TSCA) Tracking System (FTTS)

State List

- State Hazardous Waste Sites (SHWS)
- Permitted Solid Waste Disposal Facilities/Landfill (SWF/LF)
- Leaking Storage Tank Incidents (LTANKS)
- Registered Petroleum Bulk Storage Sites (UST/AST)
- Chemical Bulk Storage (CBS) Database (UST/AST)
- Voluntary Cleanup Program Applicants/Participants (VCP)
- Major Oil Storage Facility (MOSF)
- Registered Waste Tire Storage & Facility List (SWTIRE)
- Registered Recycling Facility List (SWRCY)
- New York Spills (NY SPILLS)
- Hazardous Substance Waste Disposal Site Inventory (HSWDS)
- Delisted Registry Sites (DEL SHWS)

Proprietary List

- Former Manufactured Gas Sites (Coal Gas)

Federal and State Database Sites

- Three CERCLIS sites have been identified within the ASTM search distance. The CERCLIS list includes sites that are either on or proposed to be on the National Priorities List. One site, *BCF Oil Refining, Inc.*, is located 1/4 - 1/2 mile downgradient (east-northeast) of the subject property. Two other sites are listed as No Further Remedial Action Planned (NFRAP), indicating that the no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require federal Superfund Action or NPL consideration. Since these sites are located downgradient from the subject property, environmental impacts to the subject property are not anticipated. These sites are not considered RECs.

- One RCRIS-LQG site has been identified within the ASTM search distance. The site is *Jos H Lowenstein & Sons Incorp.*, located 1/8 - 1/4 mile west-northwest of the subject property, which is presumed to be upgradient from the subject property. This site has been issued six violations all of which have been complied with. This site is not likely to impact the environmental conditions on the subject property and is not considered a REC.

- Seven RCRIS-SQG sites are identified within the ASTM search distance. These sites have been listed with either no violations or violations, which have been complied with. These sites are not anticipated to environmentally impact the subject property at this time and are not considered RECs.

- Two SHWS sites are listed within the ASTM search distance. These sites are as follows: *B.C.F. Oil Refining, Inc*, located 1/4-1/2 mile east-northeast of the subject property; and *Phelps Dodge Refining Corp.*, located 1/2-1 mile northeast of the subject property. Since these sites are either located cross/downgradient of the subject property or do not have any recorded violations, impacts to the subject property are not anticipated and are not considered RECs.

- Eleven SWF/LF sites are identified within the ASTM search distance. These sites have no recorded violations and impacts to the environmental conditions on the subject property are not likely. These sites are not considered RECs.

- Thirty LTANKS sites have been identified within the ASTM search distance. Of the thirty listed LTANK sites, fourteen sites are located down/cross-gradient of the subject property, not within the inferred groundwater flow path. Ten of the remaining sixteen sites have been listed as cleaned up to the satisfaction of NYSDEC and closed.

  Six sites are located upgradient or adjacent to the site, and are as follows:

Site Name	Location in Reference to Subject Property
Jos H Lowenstein & Son	0 to 1/8 mile west-northwest
Cooper Park Housing	1/8 to 1/4 mile west
287 Maspeth Ave	1/8 to 1/4 mile northeast
Greenpoint Energy Facility	1/8 to 1/4mile northeast
Sunoco S/S	1/4 to 1/2 mile west
308 Maujer Steet	1/4 to 1/2 mile south-southwest

  All six upgradient sites are listed as tank test failures or tank overfills without a listed NYSDEC closure date. Due to the lack of closure dates, and their presumed upgradient location, these sites could potentially be a source of contamination on the subject property. However, groundwater is not used as a potable water supply in this area. These sites present a *de minimis* environmental concern, and are not considered RECs.

- Ten UST sites are identified within the ASTM search distances. Three of the ten listed sites are located upgradient to the subject property. One of these is listed as closed the remaining two are: *Joseph H Lowenstein & Sons Inc.,* located 1/8 to 1/4 mile west-northwest and *Cooper Park,* located 1/8 to 1/4 mile to the west of the subject property.

The remaining seven listed UST sites are located downgradient to the subject property. The presence of registered storage tanks does not indicate an area of environmental concern unless the tanks have leaked product into the subsurface. Based on the database review there is no reason to conclude the storage tanks have had a negative impact on the subject property and are not considered RECs.

- Eight MOSF UST/AST sites were listed within the ASTM search distances. These registered onshore facilities or vessels may contain petroleum storage capacities of 400,000 gallons or greater. Since these sites are either located down or cross gradient to the subject property and currently listed as in compliance, these sites are not likely to affect the environmental conditions on the subject property and are not considered RECs.

- Three VCP/Brownfields sites were identified within the ASTM search distances. Two of these sites: *Greenpoint Energy Facility* and *Greenpoint Center,* located at 287 Maspeth Avenue are upgradient to the subject property and within the inferred groundwater flow path of the subject property. These sites could potentially be a source of contamination on the subject property. However, these sites are in the process of remediation and groundwater is not used as a potable water supply in this area. These sites present a *de minimis* environmental concern, and are not considered RECs.

- Two HSWDS sites are identified within the ASTM search distance. The three HSWDS sites are as follows: *Brooklyn Equity Works* located 0-1/8 mile east-northeast of the subject property on Maspeth and Morgan Avenues and *Greenpoint Energy Facility*, located 0-1/8 mile west of the subject property. Both sites were former coal gasification sites. By products from this industry includes hydrocarbons, which were found in the soils at these sites. The hydrocarbons at the Brooklyn Equity Works facility were reportedly removed when the facility was decommissioned in 1928. Due to the inferred groundwater flow path at the subject property, these sites could potentially be a source of contamination on the subject property. However, groundwater is not used as a potable water supply in this area and therefore, these sites present a *de minimis* environmental concern, and are not considered RECs.

- Seven NY Spills sites are located within the ASTM search distance. Four of these sites are listed as closed by NYSDEC and one site is located south and downgradient of the subject property. The two remaining sites are located at: *Maspeth Avenue/Vandervoort Avenue,* and *301 Vandervoort Avenue.* These sites are located upgradient or cross gradient to the subject property. Both these sites have surface releases that do not typically travel beyond the immediate vicinity of the spill area. Due to the nature of the release, impacts to the subject property are not expected and these sites are not considered RECs.

- One coal gas site was identified within the ASTM search radius. The site, *Settle Brothers Tannery*, is located 1/2 to 1 mile southeast downgradient of the subject property. Therefore, impacts to the subject property are not expected and this site is not considered a REC.

Regulatory File Review

Freedom of Information Act requests (FOIA) were sent to the United States Environmental Protection Agency (Region II), the New York State Department of Environmental Conservation (Region II), the New York City Department of Environmental Protection (NYCDEP), the New York City Department of Health (NYCDOH), New York City Department of Buildings (NYCBOD), and the New York City Fire Department (NYCFD).

- USEPA – Results of file search are pending.

- NYSDEC– Results of file search are pending.

- NYCDEP – Results of file search are pending.

- NYCDOH – Results of file search are pending.

- NYCBOD – Results of file search are pending.

- NYCFD – Results of file search are pending.

Copies of the requests and responses are included in Appendix E.

The agencies usually take six to eight weeks to process FOIA requests. Any relevant responses from the remaining regulatory agencies will be reviewed and forwarded upon receipt.

4.5 Results of Site History /Land Use Review

According to the Historical Sanborn Fire Insurance Maps, the subject property was vacant in the 1888 map, then developed since at least 1907 by Brooklyn Union Gas Co. through 1933. The property has been noted as vacant from 1951 through 1995.

4.5.1 Personal Interviews

An interview with Mr. Ray Kvedaras, general manager of the Copper Tank Transfer facility, was conducted as part of this Phase I ESA. Mr. Kvedaras explained the vacant lot is used as temporary storage space for large machinery.

4.5.2 Site Records Review

No records were reviewed at the time of site inspection.

4.5.3 Building Department Records Reviews

FOIA requests were submitted to the NYCDOB, results of the file search are pending.

4.5.4 Aerial Photograph Review

Aerial photographs were obtained and reviewed for the years 1954, 1966, 1975, 1984, and 1994. No RECs were established from the aerial photographs. Copies of the aerial photographs are provided in Appendix D.

4.5.5 Fire Insurance Map Review

In order to ascertain prior usage and ownership information at the above-mentioned property, requests were made to Environmental Data Resources (EDR) for Sanborn Fire Insurance Maps.

Sanborn Fire Insurance Maps from the years 1888, 1907, 1933, 1951, 1965, 1968, 1977, 1979, 1980, 1981, 1982, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1994, and 1995 were obtained and reviewed. The following is a summary of the subject and surrounding properties as depicted on the Sanborn Fire Insurance Maps:

1888 The subject property is vacant and shows no signs of development. Surrounding properties include: Bushwick varnish works on the corner of Calhoun Street and Grand Avenue to the south, to the south east is a lumber yard and a brickyard.

1907 The subject property is occupied by Brooklyn Union Gas Company, which contains a gas holding tank and two above ground tanks with unknown content. The surrounding properties consist of J.R. Crombie & Co. storage facility, Joseph A. Solan Saw and Planing Mill, J.A. Crombie & Co., and Rader Fire Proofing Co. to the south and, Standard Rope and Twine Co. to the west.

1933 The subject property is now vacant. The surrounding properties appear as the 1907 map with the development of Egg Yolk Mfg. on the western section of the subject block. The property occupied by J.R. Crombie & Co. and Joseph A. Solan on the 1907 map is occupied by Chapman Dock Co. The property to the west depicted as Standard Rope and Twine Co. on the 1907 map is occupied by The Lignum Chemical Works. The lots south

of The Lignum Chemical Works are occupied by Oxford Filing Supply Co. and a fur dying facility.

1951 The subject property remains essentially the same as the 1933 map. The Lignum Chemical Works is occupied by Royal Yarn Dyeing Corp. and the fur dying facility is occupied by Globe Products Co.

1965 The subject property remains vacant. The property directly to the west is noted as storage. Properties further west are noted as valve storage facilities. Properties to the south are occupied by the Newtown Creek Development with the Salwen Paper Co, Inc and the Lack Carpet Co.

1968 The subject property and surrounding properties remains the same as the 1965 map.

1977 The subject property remains vacant. The surrounding properties to the west remain essentially the same as the 1951 map. The Chapman Dock Co. located south of the subject property is now occupied by Salwen Paper Co, Inc and Lack Carpet Co.

1979 The subject property and surrounding properties remain essentially the same as the 1977 map.

1980 The subject property and surrounding properties remain essentially the same as the 1979 map.

1981 The subject property and surrounding properties remain essentially the same as the 1977 map.

1982 The subject property and surrounding properties remain essentially the same as the 1981 map.

printed on recycled paper

1986 The subject property block is now vacant with the exception of 252 Maspeth Avenue, which is still occupied by as a storage facility.

1987 The subject property and surrounding properties remain essentially the same as the 1986 map.

1988 The subject property and surrounding properties remain essentially the same as the 1987 map.

1989 The subject property is noted as utilized for garbage transfer storage. Surrounding properties remain essentially the same.

1990 The subject property and surrounding properties remain the same as the 1989 map.

1991 The subject property and surrounding properties remain the same as the 1990 map.

1992 The subject property and surrounding properties remain the same as the 1991 map.

1993 The subject property remains vacant; the property to the immediate west remains noted as storage, and the property at 222 Maspeth Avenue is noted as a garbage transfer storage facility. The surrounding properties remain essentially the same as the 1981 map.

In summary, the Sanborn Fire Insurance Maps indicate that the subject property was vacant in 1888, then developed since at least 1907 by Brooklyn Union Gas Co. through 1933. The property has been noted as vacant from 1951 through 1995. Surrounding property usage has been primarily manufacturing and industrial. Since the subject property and surrounding properties have a history as being utilized for manufacturing and industrial usage, the subject property may be impacted. However, the historic usage of the subject and surrounding properties present a *de minimis* environmental concern, and are not considered RECs but have the potential to impact the subject property by groundwater migration of off-site contamination.

Additionally, the shallow groundwater underlying the subject property has no known potable or other use.

Copies of the Sanborn Fire Insurance Maps are provided in Appendix C.

4.6 City Directory Abstract

Gannett Fleming obtained a City Directory Abstract from EDR in order to ascertain prior usage information for the subject property.

The Directory Abstract provided by EDR lists does not list subject property on any of the years. Listings were not provided for every year, and do not necessarily provide site ownership information. The surrounding properties are listed as: Schebler, Jos., Egg Yolk Manufacturer at 218 Maspeth Avenue and Phillip Carr, Bohner Varnish Co. at 221 Maspeth Avenue. Both of these properties are listed for the year 1934. For the address 222 Maspeth Avenue, Cooper Tank Transfer Station is listed in 1997 and Cooper Tank Transfer in 2000.

Copies of the City Directory Abstract are provided in Appendix C.

4.7 Synopsis of Previous Environmental Investigations

No previous environmental investigation reports were provided to Gannett Fleming.

4.8 Results of Suspect ACM Observations

The subject property was unimproved and no suspect ACM was observed.

Printed on recycled paper

4.9 Results of Radon Investigations

The subject property consists of a vacant temporary storage lot. No improved structures exist on the property; therefore radon would not be a concern pertaining to the environmental conditions of the site.

printed on recycled paper

5.0 CONCLUSIONS

Gannett Fleming had performed this Phase I *Environmental Site Assessment* in conformance with the scope and limitations of ASTM Practice E 1527 for the property located at 254 Maspeth Avenue, Brooklyn, New York, the *subject property*. Any exceptions to, or deletions from, this practice are described in Section 7.0 of this report.

This assessment has revealed the following evidence of *recognized environmental condition* (REC) in connection with the subject property:

- Surficial soil staining was observed on-site during the site inspection indicative of vehicle or machinery equipment leaks of oils or other fluids.

Gannett Fleming recommends that a Phase II investigation be performed to investigate potential soil and groundwater contamination due to the soil staining at the subject property.

The following sites present a *de minimis* environmental concern, and are not considered RECs but have the potential to impact the subject property by groundwater migration of off-site contamination. However, the shallow groundwater underlying the subject property has no known potable or other use.

- Six upgradient LTANK sites are listed as tank test failures or tank overfills. These sites lack a NYSDEC closure date.

- Review of the historical sanborn fire insurance maps revealed that the subject property and surrounding properties have a history as being utilized for manufacturing and industrial usage.

printed on recycled paper

6.0 RECOMMENDATIONS / COST ESTIMATES

Gannett Fleming recommends that a Phase II investigation be performed to investigate potential soil and groundwater contamination due to the current findings (stained soil) and the historical use of the subject property.

We are aware that a Phase II has been recently performed on the subject property by the owner, however, we have not received or reviewed the final report.

Our recommendations are to include a characterization of subsurface conditions at the site.

Additional inquiry would include Phase II soil borehole advancement and sample collection using a Geoprobe drill rig. We recommend that four boreholes be advanced to groundwater, and will be continuously sampled and field screened for the detection of any possible contamination. One grab soil sample will be collected from the bottom of each borehole or at the point demonstrating the most petroleum contamination. Two groundwater samples would also be collected from two of the four boreholes. Soil and groundwater samples will be collected using decontaminated equipment and submitted to a New York State Department of Health certified laboratory for analysis of volatile organic compounds (VOCs), semi-volatile compounds (SVOCs), metals, and polychlorinated biphenyls (PCBs).

Cost of Phase II Activities

Engineering Fee	$2,500
Drilling Fee	$1,500
Analytical Fee	$3,000
	$7,000

printed on recycled paper

The fee assumes that the site work will be completed in one day, with four soil samples and two groundwater samples collected and submitted for a laboratory standard analytical turn-around-time of ten business days.

printed on recycled paper

7.0 LIMITATIONS

This Phase I ESA report is based partially on information obtained from others and Gannett Fleming makes no representation or warranty concerning the accuracy or completeness of this information in describing site operations or environmental conditions. Some of the information presented in this report may be subject to varying interpretations and conclusions. The information contained in this report was developed from information available and conditions observed on the survey date. Gannett Fleming is not liable for financial or other losses or subsequent damage caused by or related to any use of this document.

This report was prepared for the sole use of Cooper Tank and Welding Corp. Any other distribution, without Gannett Fleming's written consent, is prohibited.

Re: Freedom of Information Request

Dear Mr. Hewitt:

Gannett Fleming requests copies of environmental files, records, and memoranda concerning the following property.

254 Maspeth Avenue
Brooklyn, New York 11211

This information should include:
1) past and present underground storage tank registration(s);
2) reported spills or releases of hazardous substances;
3) generation, storage, treatment, or disposal of hazardous substances;
4) past and present groundwater, surface water, and soil investigations; and
5) environmental permits/violations.

Please do not hesitate to call should you have any questions.

Very truly yours,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

EXECUTIVE SUMMARY

This investigation was completed based on EEA's proposal to perform a Phase II Subsurface Investigation (dated September 7, 2004) at 254 Maspeth Avenue in Brooklyn, New York. The subject property is a vacant lot approximately 28,000 square feet in area. A sampling and analysis program was designed to determine if prior and/or present uses on the subject property have impacted the subsurface soils and environment. The sampling and analysis plan consisted of soil quality testing using analytical test methods consistent with expected parameters and agency soil cleanup guidelines. The following presents an evaluation of our investigation.

Since the subject property is a vacant lot, a total of six (6) soil borings (B-1, B-2, B-3, B-4, B-5 and B-6) were advanced on-site in areas of access since the site was being used as a repository of trucks and other vehicle related parts. Soil samples were collected from soil boring B-1 from the 4 to 8 feet depth interval and the 8 to 12 feet depth interval to characterize subsurface conditions on-site. Soil samples were collected between the 0 to 4 feet depth interval in borings B-2, B-3, B-4, B-5 and B-6. Soil samples were collected and tested for volatile organic compounds (VOCs) using USEPA Method 8260, semi-volatile organic compounds via USEPA Method 8270 (STARS List) and the RCRA Metals. Laboratory analysis of soil samples detected SVOCs in all six borings above the New York State Department of Environmental Conservation's (NYSDEC) Technical and Administrative Guidance Memorandum (TAGM) soil cleanup criteria. Laboratory analysis of soil samples also detected various RCRA metals (arsenic, barium, cadmium, chromium and mercury) in all six borings above NYSDEC TAGM soil guidelines as well as above Eastern US Background levels for this region. There were also several detections for VOCs in two soil borings (B-2 and B-3), however the detection levels were well below NYSDEC TAGM soil cleanup guidelines.

This property is located in a commercial use area and the soils underlying the property are composed of fill material consisting of brick, wood chips and asphalt materials intermixed with sand, gravel and soil. This type of fill material is common in industrial areas of Brooklyn and New York City. These materials commonly show higher contamination levels than other areas. EEA finds similar results in other properties it has investigated in the region. Based on the findings, EEA has no recommendation for additional testing or remediation for the site.

The NYSDEC has developed the TAGM "guidelines" in order for DEC case managers to determine potential cleanup recommendations at various sites though out the state. The NYSDEC

considers each site on a case-by-case basis in consideration of the property usage and its location to sensitive human, wildlife and environmental interests. Industrial/Commercial properties are treated differently than residential or environmentally-sensitive areas.

I. INTRODUCTION

a. Background

This investigation was completed based on EEA's proposal to perform a Phase II Subsurface Investigation (dated September 7, 2004) at 254 Maspeth Avenue in Brooklyn, New York. The subject property is a vacant lot, approximately 28,000 square feet in area. A sampling and analysis program was designed to determine if prior and/or present uses on the subject property have impacted the subsurface soils quality. The sampling and analysis plan consisted of soil testing using analytical test methods consistent with expected parameters and agency soil cleanup guidelines.

EEA initiated field activities September 20, 2004 and all Phase II activities were completed by that day. The site was located at 254 Maspeth Avenue in Brooklyn, New York (see Figure 1). This report summarizes the work performed, the results of the investigation, and the recommended remedial action.

II. SCOPE OF WORK PERFORMED

a. Health and Safety Plan

EEA uses a company Generic Health and Safety Plan for all investigative work relating to performing Phase II Environmental Subsurface Investigations. The HASP assigns responsibilities, establishes personal protection standards, recommends operating procedures, and provides for contingencies that may arise during performance of the assessment at the site. The protocols in the HASP apply to all personnel involved in the work activities including EEA, all outside subcontractors, client, or regulatory agencies present during the performance of the work. In addition, the following safety equipment is maintained on-site for responding to potential emergency situations: portable eyewash, ABC fire extinguisher, and first aid kit. Telephone numbers of emergency response units in the area are also posted where all those working at the site can easily see them. All personnel working at the site will also be required to receive training in respirator fitting, emergency procedures, equipment decontamination, and specific task procedures. All personnel involved with the collection of soil or water will have successfully completed the 40-hour OSHA Hazardous Materials Training Program.

b. Subsurface Utility Location, Permits and Bonding

EEA notified the New York City/Long Island One Call Center under the New York State Regulation Code 753 prior to initiating the work to identify the location of underground utilities in the vicinity of the proposed boring locations. Confirmation number 2580372 was assigned to

the site. Any permits for soil boring were obtained from the local agencies. In addition, any license and permit bonding required was secured for the work.

c. Investigation Work Summary

All soil sampling was completed using a Geoprobe Model 54LT using the *Macrocore* soil sampling system. Samples were field screened for volatile organic vapors using an organic vapor meter (OVM).

d. Soil Sampling Summary

As specified in the Proposal, six (6) soil borings were advanced on-site; seven (7) soil samples were submitted for laboratory analysis. Soil samples were collected from soil boring B-1 from the 4 to 8 feet depth interval and the 8 to 12 feet depth interval to characterize subsurface conditions on-site. Soil samples were collected between the 0 to 4 feet depth interval in borings B-2, B-3, B-4, B-5 and B-6. The soil samples each boring transferred directly into sterilized laboratory glassware. The samples were sent to the laboratory and were tested for:

VOCs (USEPA Method 8260),
SVOCs (USEPA Method 8270 STARS List),
RCRA Metals

e. Site Characteristics

Soils at the site consisted of fill material up to 11 feet below grade (fbg) comprised of brown soil, red brick chips, asphalt chips, wood remnants, fine to medium grained sand, gravel and clay. Possibly native material was encountered in boring B-1 at 11 fbg comprised of fine-grained, brown sand and clay. Groundwater was also encountered at this one boring at approximately 9 fbg.

Kings County, the location of the site, is underlain by a sequence of unconsolidated deposits of Pleistocene and Cretaceous age, overlying a southward dipping bedrock. The thickness of these unconsolidated deposits ranges from a few hundreds feet in the northwestern sections of Long Island to 2,000 feet along the south shore barrier beaches. These deposits form the four aquifers and two confining units. The four aquifers are the upper glacial, the Jameco, the Magothy and the Lloyd. The upper glacial (water-table) aquifer, the only aquifer encountered on-site, consists of till, outwash, glaciolacustrine and marine deposits. Bedrock underlies the Cretaceous deposits and, in some areas, the Pleistocene deposits and constitutes the lower boundary of the Lloyd Aquifer. Bedrock is composed of crystalline metamorphic and igneous rocks, muscovite-biotite schist, gneiss and granite. Since bedrock is at depth in all areas of Long Island, no outcrops were encountered on-site.[1]

III. RESULTS OF LABORATORY ANALYSES

EcoTest Laboratories, Inc. (NYSDOH Certification #10320) prepared the results of the soil samples. Tables 1, 2 and 3 present a summary of the results and a comparison to New York State Department of Environmental Conservation (NYSDEC) STARS Memo #1 and Technical and Administrative Guidance Manual (TAGM) cleanup guidelines. The chain-of-custody records, as well as the analytical laboratory data sheets, are presented in the Appendix to this report.

The soil sample collection locations are presented in Figure 1. The soil boring report logs present the field observations made at each soil boring location are also presented in the Appendix to this report. Site photographs were taken during field activities and are presented in the Appendix.

IV. FINDINGS AND CONCLUSIONS

a. Soil Sampling Summary

Laboratory analysis of soil samples detected SVOCs in all six borings above the New York State Department of Environmental Conservation's (NYSDEC) Technical and Administrative Guidance Memorandum (TAGM) soil cleanup criteria (see Table 2). Laboratory analysis of soil samples also detected various RCRA metals (arsenic, barium, cadmium, chromium and mercury) in all six borings above NYSDEC TAGM soil guidelines as well as above Eastern US Background levels for this region (see Table 3). There were also several detections for VOCs in two soil borings (B-2 and B-3), however the detection levels were well below NYSDEC TAGM soil cleanup guidelines (see Table 1).

V. RECOMMENDATIONS

This property is located in a commercial use area and the soils underlying the property are composed of fill material consisting of brick, wood chips and asphalt materials intermixed with sand, gravel and soil. This type of fill material is common in industrial areas of Brooklyn and New York City. These materials commonly show higher contamination levels than other areas. EEA finds similar results in other properties it has investigated in the region. Based on the findings, EEA has no recommendation for additional testing or remediation for the site.

The NYSDEC has developed the TAGM "guidelines" in order for DEC case managers to determine potential cleanup recommendations at various sites though out the state. The NYSDEC considers each site on a case-by-case basis in consideration of the property usage and its location to sensitive human, wildlife and environmental interests.

VI. SAMPLING METHODOLOGY

a. Quality Assurance and Quality Control QA/QC Plan

EEA implements a QA/QC Plan to ensure sample integrity and avoid contamination and/or cross-contamination of samples. All sampling equipment is cleaned before each sample is collected. When petroleum hydrocarbon contamination is encountered, all equipment is steam-cleaned. The following procedures are followed in the decontamination process:

Step 1: Steam clean equipment.
Step 2: Scrub with a bristle brush using a non-phosphate detergent (such as Alconox).
Step 3: Rinse with hot tap water.
Step 4: Rinse twice with deionized water.
Step 5: Air dry.
Step 6 Nitric Acid (5%) solution rinse (if sampling for metals)
Step 7: Rinse twice with deionized water.
Step 8: Air dry.

VII QUALIFICATIONS

EEA, Inc. is an environmental consulting firm that has undertaken environmental pollution investigations, development feasibility studies, and environmental site assessment studies since 1979. These site evaluation studies have been prepared for major lenders, public corporations, businesses, developers and governmental agencies. Approximately 4,000 parcels have been evaluated in the metropolitan New York-New Jersey area during the past twenty years, ranging from Phase I Environmental Site Assessments to comprehensive subsurface hazardous material investigations and testing programs. EEA also prepares bid specifications for remedial cleanup actions and supervises site cleanup.

EEA's principals and senior managers for the hazardous waste investigations each have over 20 years experience in environmental consulting, with established credentials in the field.

Individual qualifications of EEA personnel, including specific credentials of persons involved in the preparation of this report can be provided upon request.

VIII. DISCLAIMER

This report is for use by Spencer Realty Corporation and by Copper Tank & Welding and is only to be used as a guide in determining the potential for contamination by toxic or hazardous materials on the subject property at the time of the site visit. This Phase II Environmental

Subsurface Investigation was undertaken in accordance with generally accepted protocols, including ASTM Standards Related to the Phase II Environmental Site Assessment Process. This Phase II Investigation is based principally on the review of historic and regulatory records (made available within a reasonable time period), relating to past occupants and usage of the subject property, as well as activities at nearby sites, and upon a visual assessment of the subject property, and makes no determinations with respect to portions of the subject property and its structures which were not inspected. Our professional services have been performed using that degree of care and skill ordinarily exercised under similar circumstances by reputable qualified professionals practicing in this or similar situations. The interpretation of the field data is based on good judgment and experience. However, no matter how qualified the professional or detailed the investigation, subsurface conditions cannot always be predicted beyond the points of actual sampling and testing. No other warranty, expressed or implied, is made to the professional advice included in this report.

Any and all liability on the part of EEA, Inc. shall be limited solely to EEA's professional liability insurance (errors and omissions coverage of one million dollars). EEA, Inc. shall have no liability for any other damages, whether consequential, compensatory, punitive, or special, arising out of, incidental to, or as a result of, this assessment. EEA, Inc. assumes no liability for the use of this report by any person or entity other than the institution and/or entities or persons for whom it has been prepared.

DEC REMARKS:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "VOUGHT"

10/15/04-Vought-File review by Vought:

Access Agreement-7/10/02. Access agreement for FedEx to remove USTs and portion of tankfield on adjacent property.

Letter from Testwell Labs(Pearce) to FedEx(Swart)-7/10/02. Work proposal for installation of nine soil borings, field screening of soil samples, conversion of three of the borings into monitoring wells, quarterly sampling of the wells and further excavation of the soil and piping.

Letter from Testwell Labs(Pearce) to DEC Vought-7/22/02. Soil "samples were taken from the walls and groundwater after the underground fuel storage tanks and surrounding had been removed..." Testwell recommends: 1)backfilling of UST excavation 2)SVOC's are due to fill material 3)if wells are deemed necessary "they are to be installed at a later date after site work (piles and foundations) is complete" 4)remaining vent lines terminate at surface level and remaining contaminated soil on adjacent property should be removed.
Letter from Gannett Fleming (Ernst) to DEC Vought-8/13/02. "This letter is intended to inform the NYSDEC of the projected site remediation activities." "Based on the endpoint soil data (samples WSW and SSW no further action is

recommended for the soil beneath facility footprint which is currently under construcion". No groundwater monitoring wells are proposed inside the facility." Gannett Fleming will provide a comprehensive site investigation report on both the UST removal and for the "black tar like substance found in the southwestern portion of the site".

Report from Gannett Fleming to DEC Vought-8/28/04. "This letter provides a summary of the additional investigation activities and sample analysis that have taken place....." Removal of twenty (550-gallon) gasoline USTs and 900 tons o impacted soil. See above 7/22/02 entry for endpoint analyticals. Soil analyticals show 7750ppb 1,3,5-trimethylbenzene(WSW Wall) and 6470ppb xylene(WSW Wall), 110ppb benzene(vent x bottom), 110ppb benzene(Vent x sw), 120ppb benzene(n wall composite), 5900ppb 1,3,5-trimethylbenzene(n wall composite), 11000ppb 1,2,4-trimethylbenzene(n wall composite). Groundwater analytical from one well shows 40ppb benzene and 26ppb xylene. "Black stained soil exhibiting a strong petroleum odor was observed adjacent to the southwestern portion of the existing warehouse". Seven test pits were dug to delineate the stained soil but no groundwater samples were collected. Report recommends: 1)no further actions for soils south and west of the former UST area 2)additional delineation north and east of the former UST area via Geoprobe 3)installation of six montoring wells (two upgradient and four downgradient). Investigation activities will be provided to DEC in a supplemental site investigation report. Soil analyticals shos PAH exceedences throughout site due to fill material.

Report from Gannett Fleming to DEC Vought-6/8/04. "This letter report documents the results of investigative activities conducted...." "A review of historic Sanborn maps indicate a Brooklyn Union Gas bulk petroleum storage and distribution terminal was present in the southwestern portion of the site in 1951. Installation of six monitoring wells. An additional well was installed to replace a well destroyed in the tankfield excavation. Groundwater at a depth of 8' below grade. "..groundwater flows to the north in the northern portion of the site. Groundwater flows converge to the east in the southern portion of the site". Groundwater analyticals show 21ppb ethylbenzene(MW1), 13ppb 1,3,5-trimethylbenzene(MW1), 97ppb napthalene(MW1), 10ppb benzene(MW2), 7ppb ethylbenzene(MW2), 93ppb napthalene(MW2), 20ppb benzene(MW7), 7ppb ethylbenzene(MW7), 35ppb xylene(MW7), 52ppb napthalene(MW7). Soil analyticals showed no VOC exceedences and SVOC exceedences attributable to fill material. Report recommends: 1)no further action with respect to soil 2)no further action for onsite groundwater due to "poor regional groundwater quality". Report requests no further action. DEC requires: 1)one full year of groundwater monitoring prior to closure.

10/18/04-Vought-Sent letter with above requirement.

9/27/05 - Obligado - SITE TRANSFERRED FROM VOUGHT TO OBLIGADO

9/30/05 - Obligado - Called Manfred Bohms, left message.

10/03/05 - Obligado - Spoke with Manfred Bohms (516) 671-8440. Said that a final quarterly monitoring report should be received by Department in a few weeks.

11/7/05 - Obligado - Review final quarterly monitoring report. Ground water results show 28 ppb benzene (MW1), 28 ppb ethylbenzene (mw1), 10 ppb xylenes (mw1), 3 ppb benzene (mw3), 34 ppb benzene (mw7), 6 ppb toluene (mw7), 32 ppb xylenes (mw7), 150 ppb napthalene (mw7). Conclusions: GW data indicate ground water contmaination is stagnant. GW flow and quality have remained consistent throughout monitoring program. Stagnant gw plume indicate groundwater impacts "representative of regional groundwater quality". Requests no further action. Will discuss with Joe Sun.

12/22/05 - Obligado - Spoke with Koon. Approves NFA. Minor residual contamination possibly coming from offsite - former Brooklyn Union is across the street. Spill closed. Letter sent.

DEC REMARKS:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "VOUGHT"

10/15/04-Vought-File review by Vought:

Access Agreement-7/10/02. Access agreement for FedEx to remove USTs and portion of tankfield on adjacent property.

Letter from Testwell Labs(Pearce) to FedEx(Swart)-7/10/02. Work proposal for installation of nine soil borings, field screening of soil samples, conversion of three of the borings into monitoring wells, quarterly sampling of the wells and further excavation of the soil and piping.

Letter from Testwell Labs(Pearce) to DEC Vought-7/22/02. Soil "samples were taken from the walls and groundwater after the underground fuel storage tanks and surrounding had been removed..." Testwell recommends: 1)backfilling of UST excavation 2)SVOC's are due to fill material 3)if wells are deemed necessary "they are to be installed at a later date after site work (piles and foundations) is complete" 4)remaining vent lines terminate at surface level and remaining contaminated soil on adjacent property should be removed.
Letter from Gannett Fleming (Ernst) to DEC Vought-8/13/02. "This letter is intended to inform the NYSDEC of the projected site remediation activities." "Based on the endpoint soil data (samples WSW and SSW no further action is

recommended for the soil beneath facility footprint which is currently under construcion". No groundwater monitoring wells are proposed inside the facility." Gannett Fleming will provide a comprehensive site investigation report on both the UST removal and for the "black tar like substance found in the southwestern portion of the site".

Report from Gannett Fleming to DEC Vought-8/28/04. "This letter provides a summary of the additional investigation activities and sample analysis that have taken place....." Removal of twenty (550-gallon) gasoline USTs and 900 tons o impacted soil. See above 7/22/02 entry for endpoint analyticals. Soil analyticals show 7750ppb 1,3,5-trimethylbenzene(WSW Wall) and 6470ppb xylene(WSW Wall), 110ppb benzene(vent x bottom), 110ppb benzene(Vent x sw), 120ppb benzene(n wall composite), 5900ppb 1,3,5-trimethylbenzene(n wall composite), 11000ppb 1,2,4-trimethylbenzene(n wall composite). Groundwater analytical from one well shows 40ppb benzene and 26ppb xylene. "Black stained soil exhibiting a strong petroleum odor was observed adjacent to the southwestern portion of the existing warehouse". Seven test pits were dug to delineate the stained soil but no groundwater samples were collected. Report recommends: 1)no further actions for soils south and west of the former UST area 2)additional delineation north and east of the former UST area via Geoprobe 3)installation of six montoring wells (two upgradient and four downgradient). Investigation activities will be provided to DEC in a supplemental site investigation report. Soil analyticals shos PAH exceedences throughout site due to fill material.

300 Maspeth Ave, Brooklyn, NY
Soil Boring Work Plan

Dear Mr. Swart:

ISO 9001 CERTIFIED

On or about July 11, 2002 Testwell Laboratories, Inc. (TLI) will conduct a soil boring operation to delineate the extent of petroleum contamination regarding the above referenced site. Prior to the start of work the area must be free from equipment and debris, also all utilities will be marked out through the "One Call" Service.

The work activities are as follows:

NVLAP LAB CODE 200083-0

1. Initially TLI proposes to perform a total of nine soil borings around the tank pit area, three of which will be converted into ground water monitoring wells.
2. Field soil screening will be performed for each boring and additional borings may be required to delineate the extent of contamination extending out radially and staggered from the initial borings.
3. Three of the borings will be converted into monitoring wells (one well will be on the adjacent property - Duggan). These wells will be capped and two will extend above ground level and one will be flush mounted with the asphalt (adjacent property).
4. The wells will be sampled on a quarterly basis for a minimum period of one year therefore access must be provided for that time.
5. After the pit has been filled in (to minimize undermining) the vent pipes and soil around them will be removed in an effort to dispose of the gross contamination.

AASHTO R18

NYS DOH ELAP #10871, 11142 & 11651

Testwell Laboratories, Inc. Ossining, NY is accredited by the American Industrial Hygiene Association (AIHA) in the Industrial Hygiene program CERT. NO. 100147

TESTWELL LABORATORIES, INC.

Mr. Jerry Swart, Managing Director, Environmental Services
RE: FedEx Ground
300 Maspeth Avenue
Soil Boring Work Plan

July 10, 2002
Page 2 of 2

TLI will obtain soil and water samples from the borings/monitoring wells and have them analyzed using EPA Method 8021 & 8270 (STARS) in addition to Lead and MTBE to determine quantity and characterization of the contamination. After the sample results have been reviewed a recommendation will be made whether to install a remediation system or continue excavation to clean soil.

If you have any questions regarding this matter please do not hesitate to call us at (914) 944-2592.

Sincerely,

Dean Pearce

SITE ACCESS AGREEMENT

THIS AGREEMENT is made and entered into this 10th day of July, 2002 by and between **JC-DUGGAN, INC., BRIA REALTY CORPORATION**, its successors and assigns (collectively "Grantor"), with offices at 320 Maspeth Avenue, Brooklyn, New York (the "Property") and **FEDEX GROUND PACKAGE SYSTEM, INC.** ("FedEx"), with offices at 1000 FedEx Drive, Moon Township, Pennsylvania (Grantor and FedEx are hereinafter collectively referred to as the "Parties"),

WHEREAS FedEx requires access to the Property for the limited purpose of removing two (2) suspect underground fuel tanks and piping associated with FedEx's fuel system and installing, maintaining and sampling, at its sole cost, expense and risk, soil borings, test pits and temporary monitoring wells associated with investigative/remedial activities related to contamination emanating from the Neighboring Premises located at 300 Maspeth Avenue, Brooklyn, New York owned by FedEx (the "Work").

WHEREAS contamination having been identified on the 300 Maspeth Avenue, Brooklyn, NY premises (the "Neighboring Premises"), the Work is required to be supervised by the New York Department of Environmental Conservation ("NYDEC") to evaluate the nature and extent of said contamination.

WHEREAS FedEx has retained various contractors ("Agents") to perform the Work on FedEx's behalf; and

WHEREAS Grantor agrees to provide FedEx and its Agents, with access to the Property to perform the Work;

NOW THEREFORE, in consideration of the promises, mutual covenants and agreements contained herein, the Parties agree as follows;

1. Grantor hereby grants FedEx and its Agents, permission to enter upon the Property for the limited purpose of performing the Work. The Work shall be performed in accordance with all applicable statutes, ordinances, rules, regulations, orders and requirements of all Governmental Authorities.

2. FedEx and its Agents, shall:

   a) perform the Work in a workmanlike manner and in accordance with industry standards and shall exercise all measures to conduct the Work so as to minimize the disturbance of existing conditions at the

Property;

b) minimize any business disruption by exercising all measures to limit the area of activity to the area in and around the suspected contamination; however, Grantor expressly agrees that FedEx and its Agents, are permitted to perform the Work during normal business hours (during weekdays only between 8:00 am-3:00 pm);

c) obtain all required utility mark-outs prior to conducting the Work and to take all measures necessary to prevent any disturbance or damage whatsoever to such utilities;

d) provide any necessary restoration work pursuant to Paragraph 7 of this Agreement;

e) at Grantor's request, provide Grantor with split samples of any samples taken in connection with the performance of the Work; and

f) upon completion of the Work, FedEx and its Agents, shall provide Grantor with a map showing the precise location of the sampling points and copies of reports of the analytical results of the sampling work.

3. Prior to commencing the Work at the Property, FedEx and its Agents, shall notify Grantor at least 24 hours prior to entry onto the Property, provide written notice describing the specific location, physical work, sampling to be conducted, and parameters for lab analysis, for which access is sought and must obtain Grantor's approval.

4. Any notice required under this Agreement shall be made by facsimile or overnight courier to both parties at the addresses listed below, or to any other addresses subsequently provided by the Parties. Notice shall be complete upon its receipt by the addressees listed below'

1000 FedEx Drive
Moon Township, PA 15108
Facsimile No. (412) 859-5450

5. All equipment necessary to perform the Work and any needed restoration work must be removed from the Property on a daily basis at the conclusion of work for that day. If necessary to complete the Work, FedEx shall be responsible for moving the 20-foot ocean freight container located on the Property, utilized for storage purposes, to a temporary location approved by Grantor. Upon completion of the Work, FedEx will replace said container in its original location.

6. Following completion of the Work, FedEx or its Agents, shall restore the Work area to substantially the same condition existing prior to commencement of their entry onto the Property, including the removal of all equipment used in the performance of the Work. Restoration shall include:

a) replacement of the excavated soils with compacted, certified clean fill material;

b) replacement of any removed or damaged landscaping; and

c) replacement of any pavement, including, as necessary, parking lines, signs, or any other parking accouterments.

7. FedEx and its Agents, shall provide Grantor with copies of any correspondence with the NYDEC regarding the Work within 5 business days of the date

of such correspondence.

8. This Agreement obligates FedEx to be responsible for the investigative and remedial costs associated with the contamination emanating from the Neighboring Premises, which may be migrating onto the Property.

9. FedEx hereby releases and discharges and shall defend, indemnify and hold Grantor harmless from any and all damages, demands, losses, claims, liabilities and penalties, including attorney's fees and costs, whether brought against Grantor by third-parties who do not have a contractual relationship with Grantor, including governmental entities, or by third parties with whom Grantor has contracted, in each case, caused by the performance of the Work or other activity by FedEx or its Agents in the vicinity of the Property in connection with the performance of the Work, including liability for the remediation of any environmental contamination which is emanating or which emanated from the Neighboring Premises or caused by FedEx, but excluding liability for any pre-existing contamination found on the Property not caused by FedEx. Grantor shall notify FedEx in writing of any indemnity claim arising under this paragraph 9 and give FedEx the opportunity to defend.

10. Each Agent(s) shall maintain Comprehensive General Liability ("CGL"), with a minimum limit of $5,000,000, and Workmen's Compensation policies. Said policies are incorporated herein by reference. All premiums or other costs associated with the required insurance shall be borne solely by Agent(s). Grantor will be named on the Certificate of Insurance for Agent(s)'s CGL policy as an additional insured and shall provide the certificates to Grantor's counsel prior to commencing the Work.

11. This Agreement is not intended to, and does not, create any form of agency relationship between Grantor and FedEx and its Agents.

12. This Agreement is solely for the benefit of the Parties, and it shall not be transferable, assignable, or otherwise alienable, to any other party without prior written consent of the Parties.

13. The right to access conferred by this Agreement is terminable by Grantor immediately upon notice to FedEx and shall not be construed as any form of interest in the Property, including, but not limited to, an ownership, tenancy and/or operational interest.

14. This Agreement is the complete and exclusive statement of the terms and conditions hereof, notwithstanding any representations or statements to the contrary

heretofore made. Any modifications to this Agreement shall be in writing, executed by both Parties and shall specifically state that it is such a modification.

15. The parties to this Agreement represent that they have read and understand its terms. Each party, if so desired, has been advised by counsel as to its meaning and legal implications and freely executes this Agreement.

16. Each person executing this Agreement represents that the party on whose behalf the person is executing this Agreement has duly authorized the execution of this Agreement and that such person is authorized to execute the Agreement on behalf of such party.

17. This Agreement may be executed in several counterparts, each of which may be deemed an original, and all of such counterparts together shall constitute one and the same Agreement.

18. This Agreement may be executed by facsimile transmission and shall be deemed to have been executed and delivered by each party on the date so transmitted to the other party, and in such event, each party will promptly furnish to the other party, an original counterpart hereof executed by such party.

IN WITNESS HEREOF, the Parties hereto have executed, or caused to be executed, this Agreement as of the date and year first written below.

Date: 7/17/02 12:24PM
Subject: FedEx Ground Maspeth Ave.

Jeff; confirming our discussion, we found an oily substance on the groundwater during excavation activities along the west side of the facility this week. Per your instruction I notified the hotline-spill #0204002. The photos and site maps showing approximately locations are attached.

We will likely backfill the excavations where we encounter this material so we don't delay construction with the understanding we will address this unknown substance as construction advances.

There does not seem to be any consistent encounter with this material. Less than 15 feet away they did not observe this, so we are not sure if it is isolated, however Gilbane believes they also observed this oil on the east side as well so we do not know the extent of this yet.

You are welcome to visit the site today at 1PM when Gannett Fleming and Testwell will be meeting to discuss the situation.

If you discover any information on any potential off-site sources for this oil please let us know.

Thanks.

Regarding: FedEx Ground Facility
300 Maspeth Ave, Brooklyn, NY
Soil Sampling Results

Dear Mr. Vought:

We have reviewed the results for the soil samples taken on July 3, 2002 regarding the above referenced site. These samples were taken from the walls and groundwater after the underground fuel storage tanks and surrounding soil had been removed resulting in a 56 FT. Wide X 42 FT. Long X 10 FT. Deep excavation. We recommend the following:

1. The Underground Storage Tank area is relatively clean according to the results and request that the area be backfilled as no further excavation is warranted.
2. Any high Semi-Volatile Organic Compound readings are probably due to the site condition of 7 FT. – 8 FT. layer of fill material over a layer of peat.
3. If wells are deemed necessary due to the high Benzene level in the groundwater sample, they are to be installed at a later date after site work (piles and foundations) is complete.
4. The remaining vent lines that terminate at the surface level and associated contaminated soil on the adjoining property should be removed.

We believe that the Photoionization Detector's (PID) readings were high when excavation was halted due to the decomposition of the peat layer and methane gas permeating up through the fill layer. The excavation of the soil around the removed tanks has evidently removed the fuel oil contaminant.

Re: FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804

Dear Mr. Vought:

Gannett Fleming Engineers and Architects, P.C. has been retained by FedEx Ground to provide environmental consulting services at the 300 Maspeth Avenue facility in Brooklyn. This letter is intended to inform the New York State Department of Environmental Conservation (NYSDEC) of the projected site remediation activities surrounding the underground storage tanks (USTs) related to the construction at the site.

As we discussed on Wednesday, August 7th, data collected by Testwell Laboratories, Inc. indicated the UST excavation end points were substantially in compliance with NYSDEC Recommended Soil Cleanup Objectives with the exception of the soil sample collected along the northern wall of the excavation (Samples ENE, NNE, and NNW). Residual petroleum was also detected in groundwater observed in the excavation.

This characterization is important to the construction schedule, since the footprint of the facility expansion work will cover a portion of the UST excavation. The approximate location of the facility expansion footprint relative to the UST excavation is provided on the attached Location Plan.

Based on the end point soil data (Samples WSW and SSW), no further action is recommended for the soil beneath facility footprint, which is currently under construction. Additionally, no groundwater monitoring wells are proposed inside of the facility. Any future groundwater monitoring wells will be installed within parking areas and/or the 35-foot wide alleyway that will remain around the exterior of the facility. The completion of the facility expansion will not obstruct further investigation of petroleum impacts along the northern wall of the UST excavation.

Gannett Fleming will provide a comprehensive site investigation report on both the UST removal (Spill #0202804) and for the black tar-like substance found in the southwestern portion of the site (Spill #0204002) as additional data for these locations becomes available. This data is not expected to affect our recommendations.
Please indicate the NYSDEC's response to these recommendations. Your timely response will be greatly appreciated, since the construction in the former UST excavation area is proceeding rapidly.

Please call with any questions.

Very truly yours,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

Re: FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Vought:

This letter supplements our August 13, 2002 correspondence discussing the initial site assessment and projected remediation activities for petroleum impacts observed (New York State Department of Environmental Conservation (NYSDEC) Spill #0202804 and #0204002 at the FedEx Ground facility located at 300 Maspeth Avenue, Brooklyn, New York. A site location map is provided as Figure 1, attached. This letter provides a summary of the additional investigation activities and sample analysis that have taken place since the initial sampling and assessment by Testwell in July 2002.

Spill 0202804: UST Area

From June 17 to July 3, 2002, Brookside Environmental Services (Brookside) removed 20 USTs and approximately 900 tons of petroleum-impacted soil surrounding the USTs under the direction of Testwell. From July 26 to July 30, 2002, the UST excavation was backfilled by Brookside using structural fill (DOT Item 4). Gannett Fleming observed backfilling the excavation. Prior to backfilling, additional soil was removed from the northern wall and from the southwest corner of the excavation to assess the extent of volatile organic compounds (VOCs) and polynuclear aromatic hydrocarbons (PAHs) detected in the end point samples collected by Testwell (see Table 1). The remaining vent lines were excavated and removed from the neighboring property on July 30, 2002 by Brookside under the direction of Gannett Fleming. Figure 2 provides a site plan of the former UST excavation area. Photos of the UST and vent lines excavations are also provided in Attachment A.

On July 2, 2002, Testwell collected a groundwater sample from the bottom of the UST excavation. Analysis of the groundwater detected a number of VOCs above NYSDEC guidance values. However, turbidity of the sample may adversely affect the data. Therefore, a well point was also installed in the southeastern portion of the former UST

excavation to further assess groundwater quality near the former USTs. The well point will be incorporated into a site-wide groundwater investigation (see Recommendations).

Following the removal of the additional sidewall material and the remaining vent lines, end point soil samples were collected by Gannett Fleming. End point soil samples were comprised of one composite soil sample collected from three locations along the northern wall and one grab soil sample from the southwest corner of the UST excavation, and two composite soil samples from the bottom and sidewall following the removal of the vent lines along the eastern sidewall of the UST excavation (see Figure 2). The soil samples were placed in an ice-filled insulated cooler and delivered to Ecotest Laboratories, Inc. (NYSDOH Certification ID#10320). Chain-of Custody protocols were followed for the handling and delivery of the soil samples.

The soil samples were submitted for analysis of VOCs and PAHs listed in Table 2 of the NYSDEC Spill Technology and Remediation Series (STARS) Memorandum #1. The data was compared to the Recommended Soil Cleanup Objectives (RSCOs) provided in the NYSDEC Technical Administrative Guidance Memorandum #4046 dated December 20, 2000. The analytical results are provided in Table 2.

The VOC analysis detected benzene at 120 microgram per kilogram (µg/kg), 1,2,4-trimethylbenzene at 11,000 µg/kg, and 1,3,5-trimethylbenzene at 5,900 µg/kg in the north wall composite (N Wall Comp) sample at concentration above their respective NYSDEC RSCOs. The sidewall and bottom samples where the vent piping was removed (Sample Vent X Sidewall and Vent X Bottom) each detected benzene only at 110 µg/kg, above the RSCO of 60 µg/kg. No VOCs were detected above the NYSDEC RSCOs in the sample from the southwestern corner (Sample SE-RS) of the former UST excavation.

Analysis of PAHs detected benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, and benzo(a)pyrene at concentrations above the NYSDEC RSCOs in the four soil samples. No other PAHs were detected above the RSCOs.

Spill #0204002: Stained Soil in Southwestern Portion of Site

As part of the current construction activities, subsurface obstructions (large pieces of concrete) were removed to allow underpinning for a new foundation to be performed. During the removal of obstructions on July 17, 2002, black stained soil exhibiting a strong petroleum odor was observed adjacent to the southwestern portion of the existing warehouse. Two soil samples, West Side of Bldg N and West Side of Bldg S, were collected by Testwell from the stained area. These samples were submitted to Long Island Analytical Laboratories, Inc. (NYSDOH Certification ID #0220326) for analysis of the Target Compound List (TCL) VOCs and semi-volatile organic compounds (SVOCs). A site plan showing the test pit location is provided on Figure 3.

Continued . . .

Gannett Fleming conducted a review of historical Sanborn maps identified a bulk petroleum storage and distribution terminal occupied this portion of the site in 1951. However, no additional information is currently available as to the type of petroleum products stored at the former facility.

On July 31, 2002, subsequent foundation work by Gilbane Construction excavated a pit approximately 135 feet north of the stained area identified on July 17th. No staining or petroleum odors were reported in this excavation (see photos in Attachment A); however, no soil samples were collected.

On August 2, 2002, Gannett Fleming directed the excavation of six additional test pits (identified as TP-1 through TP-6) surrounding the location of stained soil observed on July 17th. Test pits were excavated at approximate 30-foot intervals until PID readings from the unsaturated soil remained at background levels. The excavated material was screened using a photo-ionization detector (PID).

The test pits were excavated to approximately nine feet below grade, approximately one foot into the water table. The water table was inspected for indications of free-floating product. Other than a sheen on the groundwater, no free-floating product was observed in TP-1 through TP-6. Groundwater samples were not collected as part of this investigation.

Three grab samples were collected from the test pits exhibiting background PID readings; TP-3, TP-5, and TP-6. The samples were handled in the same manner as the UST excavation samples discussed above and submitted to Ecotest Laboratories, Inc. for analysis of STARS Memo #1 Table 2 parameters. The locations of the test pits are provided on Figure 3. Test pit logs including PID readings collected from the test pits are provided in Attachment B.

The analytical data from both Testwell and Gannett Fleming samples did not detect VOCs above the NYSDEC RSCOs. Analysis of PAHs detected benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, and dibenzo(a,h)anthracene at concentrations above the NYSDEC RSCOs in the five soil samples. Indeno(1,2,3-c,d)pyrene was detected at a concentration above the RSCO in one sample. No other SVOCs were detected above the RSCOs. Laboratory data is provided on Table 3. Laboratory data sheets are provided as Attachment C.

Conclusions

- Current end point sample data indicates concentrations of VOCs in the western and southern walls of the UST excavation are below the NYSDEC RSCOs.

Continued . . .

- Concentrations of benzene in the eastern side wall and benzene, 1,2,4-trimethylbenzene, and 1,3,5-trimethylbenzene in the northern side wall on the UST excavation remain above the RSCOs.
- Concentrations of SVOCs detected above the RSCOs were limited to the PAHs including benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, and benzo(a)pyrene, site wide.
- PAHs were detected above the RSCOs in 9 of 12 samples surrounding the UST excavation.
- No concentrations of VOCs were detected above the RSCOs in soil samples collected from the southwestern portion of the site.
- PAHs were detected above the RSCOs in 4 of 5 samples collected in the southwestern portion of the site.

The occurrence of PAHs in the soils at the FedEx Ground facility appear to be ubiquitous within the urban fill material (wood, brick, glass, concrete, soil, etc.) observed in the excavations and presumably placed on the site when first developed in the 1950's. Concentrations of PAHs in soil samples were consistent through out each impacted area in both the Testwell and Gannett Fleming data. Soil samples collected from areas away from the observed impacted areas also detected PAHs. The distribution of PAHs and consistency in their concentrations is indicative of the general fill quality found at the site.

Recommendations

The following recommendations are provided for both the former UST area and the southwestern portion of the site.

Former UST Area

- No further actions are recommended for soils south and west of the former UST area. VOCs were not detected above the NYSDEC RSCOs, and concentrations of PAHs appear characteristic of the urban filled placed at the site (see below).
- Additional delineation of VOC impacts is recommended north and east of the former UST area. The VOC delineation will be conducted using a Geoprobe unit to collect 12 samples within a 25-foot grid extending from the former UST excavation (Figure 4). Soil samples will be screened vertically in two-foot intervals using a PID. Selected samples will be submitted for laboratory analysis of VOCs based on the PID readings. Because of obstructions, this work will be conducted after the current construction activities are complete (expected by October 2002).
- A groundwater investigation will be conducted over the entire site to assess local groundwater quality and to determine possible impacts from the petroleum releases on site and offsite. The groundwater investigation will also provide hydrogeologic

Continued . . .

- characterization of the site. Six shallow monitoring wells; two wells located hydraulically upgradient of the UST area and the southwestern portion of the site, respectively, and four wells downgradient of the impacted areas. The wells will be
- installed in compliance with NYSDEC guidance including 15 feet of well screen straddling the top of the water table to allow detection of free-floating product, if any. As with the soil investigation described above, this work is expected to be conducted in October 2002. Proposed monitoring well locations are provided on Figure 5.
- An investigation of general site-wide PAH concentrations will be conducted to confirm the assertion that these compounds are ubiquitous to the urban fill at the site. Soil samples will be collected during the installation of monitoring wells outlined above. Soil samples will be collected and submitted for laboratory analysis as described for the delineation of VOC impacts provided above.

The investigation activities will be provided to the NYSDEC in a supplemental site investigation report. A remedial action plan will be provided with the supplemental site investigation report, if appropriate.

Please feel free to call with any questions.

Very Truly Yours,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

Dear Ms. Donaghey:

Enclosed please find the Laboratory Analysis Report(s) for sample(s) received on July 19, 2002. Long Island Analytical Laboratories, Inc. analyzed the samples on July 23, 2002 for the following:

CLIENT ID	ANALYSIS
West Side of Building N	EPA 8021, EPA 8270, Lead
West Side of Building S	EPA 8021, EPA 8270, Lead

If you have any questions or require further information, please call at your convenience. Long Island Analytical Laboratories would like to thank you for the opportunity to be of service to you.

Best Regards,

Long Island Analytical Laboratories, Inc.

Re: FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804

Dear Mr. Vought:

On behalf of FedEx Ground, Gannett Fleming is submitting the letter report, which provides additional soil data collected at the FedEx Ground facility located at 300 Maspeth Avenue, Brooklyn, New York. A site location map is provided as Figure 1. This letter provides a summary of the additional soil investigation that was recommended in our August 28, 2002 correspondence for the delineation of volatile organic compounds (VOCs) north and east of the former underground storage tanks (USTs). A site plan depicting the location of the former USTs and delineation soil borings is provided on Figure 2.

This report also addresses the closure of a 500-gallon UST (believed to have contained waste oil) discovered during the construction work at the site, and an interim remedial measure to remove the heavily impacted soil detected during the delineation investigation.

Delineation Investigation of VOCs under Spill 0202804: UST Area

The additional delineation of VOC impacts detected in the northern and eastern limits of the UST excavation was performed on November 6, 2002. The VOC delineation investigation was conducted using a GeoProbe unit to collect twelve soil samples within a 25-foot grid extending from the former UST excavation (Figure 2). Soil samples were screened vertically in two-foot intervals using a PID. Copies of the soil boring logs are attached. The samples exhibiting the highest PID readings from each boring were submitted for laboratory analysis of VOCs. Analysis of polynuclear aromatic hydrocarbons (PAHs) were also performed by the laboratory to assess Gannett Fleming's opinion that elevated concentrations of PAHs are indicative of background levels resulting from the urban fill used in the region of Brooklyn.

No VOCs were detected in the samples that exceeded the NYSDEC Recommended Soil Cleanup Objectives in the delineation soil borings. Laboratory analytical results are provided in Table 1, and the laboratory reports are also attached.

Continued . . .

The PAH analysis detected dibenzo(a,h)anthracene at 2,200 micrograms per kilogram (ug/kg), indeno(1,2,3-cd)pyrene at 4,800 ug/kg, benzo(a)pyrene at 12,000 ug/kg, benzo(b)fluoranthene at 11,000 ug/kg, benzo(k)fluoranthene at 11,000 ug/kg, chrysene at 14,000 ug/kg, and benzo(a)anthracene at 16,000 ug/kg in sample SB-1 (0-2'), which is above the background concentrations observed at the site. An interim remedial measure was carried out to excavate and remove this affected soil for off-site disposal. The subsequent post excavation soil sample SB-1 (3-4') contained these PAHs at concentrations ranging from 640 ug/kg of dibenzo(a,h)anthracene to 3,300 ug/kg of benzo(a)anthracene. The concentrations of PAHs in the post-excavation sample are consistent with the observed background concentrations for the site. Analytical results for PAHs are provided in Table 1.

Waste Oil UST Closure

On January 8, 2003, a 500-gallon UST was discovered in the vicinity of the former garage. Historical registration information for the site indicates this tank was a waste oil tank that had not been found until that time. One vertical fill pipe from the tank was observed and capped. Brookside Environmental Services opened and cleaned the tank and removed the tank for disposal as scrap steel. The tank contained a few inches of oily water and sludge, which was drummed and disposed of off-site.

No VOCs were detected above the NYSDEC Recommended Soil Cleanup Objectives in end point soil samples TP-1 (Waste Oil Tank 4') and WOT 6', which were collected adjacent to the waste oil UST. The end point samples contained PAHs above the Recommended Soil Cleanup Objectives, but at concentrations consistent with background concentrations observed at the site. The end point soil sample data are provided in Table 1.

Conclusions

Based on the data and the work completed, the following conclusions have been established:

1. VOC concentrations exceeding the NYSDEC Recommended Soil Cleanup Objectives were not found beyond the extent of the former gasoline UST excavation.
2. Concentrations of PAHs were detected above the NYSDEC Recommended Soil Cleanup Objectives. The PAH concentrations found in the soils away from bulk petroleum storage areas further support the opinion that the PAH concentrations are consistent with background levels in the urban fill throughout this region of Brooklyn.
3. One sample location (SB-1) contained carcinogenic PAHs at concentrations not representative of background concentrations found on the site. An interim remedial measure was completed to remove the impacted soil. A supplemental post excavation sample SB-1 (3-4') detected carcinogenic PAHs concentrations consistent with the site background levels, indicating the impacted soils had been removed.

Continued . . .

4. The 500-gallon waste oil UST found in the vicinity of the former garage at the site was removed, cleaned, and the tank and its residual contents disposed of off-site. End point soil samples collected adjacent to the waste oil UST found no impacts present above the site background levels.

Based on the findings of the delineation investigation, the interim remedial measure completed, and the waste oil tank closure, no further action is necessary for the soil on the site.

The construction activities on the FedEx Ground facility are expected to be completed by the end of October 2003. The installation of monitoring wells for the groundwater investigation is anticipated to begin in early November 2003, as proposed in the August 28, 2002 report, and groundwater data should be available in late November 2003.

Please call Gregory Ernst at (516) 671-8440 with any questions regarding this matter.

Yours truly,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

Re: Site Investigation
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Vought:

This letter report documents the results of investigative activities conducted at the above referenced site. A site location map is provided as Figure 1, attached. This investigation was conducted to further assess impacts associated with two recent New York State Department of Environmental Conservation (NYSDEC) spill numbers assigned to the site. NYSDEC Spill #0202804 addresses petroleum-impacted soils discovered during the removal of 20 underground storage tanks located in the northeastern portion of the site in June and July 2002. NYSDEC Spill #0204002 was assigned to black-stained soil exhibiting strong petroleum odors discovered in the southwestern portion of the site during construction activities. A review of historic Sandborn Maps indicate a Brooklyn Union Gas bulk petroleum storage and distribution terminal was present in the southwestern portion of the site in 1951. The investigation of impacted soil associated with both spill numbers was previously discussed in our August 28, 2002 letter report.

The scope of this investigation was developed based upon the conclusions and recommendations provided by Gannett Fleming (GF) in our August 28, 2002 letter report. The purpose of this investigation was to confirm that polynuclear aromatic hydrocarbon (PAH) concentrations detected in soil are ubiquitous to the urban fill at the site and to determine if on-site and off-site petroleum releases have impacted groundwater quality at the site. Soil samples were collected from six soil borings advanced at the site. Soil samples were collected to assess PAH concentrations in soil throughout the site relative to the areas of the former underground storage tank (UST) excavation (Spill #0202804) and in the southwest portion of the site (Spill #0204002) where the former Brooklyn Union Gas terminal was present. Monitoring wells were installed in each of the boreholes to assess on-site groundwater quality. A Site Plan is provided as Figure 2.

Continued . . .

Background

In June and July 2002, Brookside Environmental Services (Brookside) removed 20 USTs and approximately 900 tons of petroleum-impacted soil from the site. Spill #0202804 was issued to the site due to the petroleum impact to the site subsurface caused by the USTs.

Soil Boring Advancement and Soil Sampling

On December 8 and 9, 2003, Associated Environmental Services, Inc. (Associated), under contract to GF, advanced six soil borings (B-1 through B-6) using a hollow stem drill rig (B-1, B-5, B-6) or a Geoprobe® rig (B-2, B-3, B-4). The soil borings were drilled at the monitoring well locations MW-1 through MW-6 in advance of installing the wells (see below). A site plan depicting the soil boring locations is provided as Figure 2, attached. Soil samples were collected continuously down to the water table using a 2-foot long split spoon (SS) sampler (B-1, B-5, B-6) or a 4-foot long Macro-Core® sampler with dedicated acetate liners (B-2, B-3, B-4). All non-dedicated sampling equipment, i.e. SS sampler, was field decontaminated using a non-phosphate detergent wash followed by a potable water rinse prior to and between each sample collection. A new acetate liner was used for each sample collected using the GeoProbe® rig. Each sample was lithologically logged and field screened for organic vapors using a photoionization detector (PID) by a GF environmental professional. The soil boring logs are provided in Attachment A.

One soil sample was retained from each boring from the depth interval exhibiting the greatest evidence (odor, staining, or PID reading) of contamination. For borings exhibiting no evidence of contamination, a soil sample was retained from immediately above the water table. Retained samples were placed in an ice-filled cooler and delivered to EcoTest Laboratories, Inc. (NELAP #10320) for analysis for VOCs by Method 8021 and PAHs via Method 8270 using New York Department of Environmental Conservation (NYSDEC) Spill Technology and Remediation Series (STARS) Memorandum #1 criteria. Chain-of-Custody protocols were followed for the handling and delivery of the soil samples.

Monitoring Well Installation and Groundwater Sampling

Monitoring wells (MW-1 through MW-6) were installed in each of the boreholes (B-1 through B-6). An additional monitoring well (MW-7) was installed in the area of the former UST excavation to replace a former well point (WP-1) destroyed during site development activities.

Continued . . .

A borehole was drilled at each well location to a depth of approximately 20 feet below grade with a drill rig using 6-inch diameter hollow stem augers, with the exception of MW-3. At MW-3, the borehole was drilled using a 4-½ inch hollow stem auger because MW-3 was installed in a pre-existing 1-foot diameter manway located within the newly constructed, reinforced concrete truck apron. Groundwater was encountered at a depth of approximately 8 feet through out the site. Monitoring wells consisting of 4-inch diameter PVC with a 15-foot screened interval were installed at each location, with the exception of MW-3 (which was completed as a 2-inch diameter monitoring well). Once the well riser was in place, each borehole was backfilled with #2 sand up to a depth of 2 feet below grade. A bentonite seal was installed above the sandpack. Wells were finished with a concrete slab and an at-grade flush-mount curb-box cover. Locking well caps were placed on all monitoring wells. GF personnel developed each of the wells using a centrifugal pump. Each well was developed by purging a minimum of 5 well volumes or until dry. Well construction logs are provided in Attachment B.

GF personnel returned to the site on January 6, 2004 to sample the on-site monitoring wells. Prior to sampling, depth to water measurements were collected from each well. Each monitoring well was purged of groundwater a minimum of three volumes or until dry using a centrifugal pump with dedicated polyethylene tubing. The wells that dried were allowed to recover prior to sample collection. Groundwater samples were collected from each monitoring well using dedicated polyethylene bailers. Samples were placed in an ice-filled cooler and delivered to EcoTest for analysis for VOCs by EPA Method 8021 and PAHs by EPA Method 8270 using NYSTARS criteria. Chain-of-Custody protocols were followed for the handling and delivery of the groundwater samples. Glassware containing a portion of the groundwater sample from MW-5 was destroyed during transport. GF personnel returned to the site on January 9, 2004 to resample the well.

The drill cuttings from monitoring installation were placed in eight 55-gallon drums for transport and disposal. On March 3, 2004, the eight drums of drill cuttings were transported from the site for disposal at Waste Recovery Solutions, Inc. in Myerstown, Pennsylvania as non-hazardous waste.

Results

Based upon groundwater elevation measurements, groundwater flows to the north in the northern portion of the site. Groundwater flows converge to the east in the southern portion of the site. A site plan depicting groundwater elevation contours is provided as Figure 2.

Re: 300 Maspeth Avenue, Brooklyn, NY
Spill #: 0202804

Dear Mr. Swart:

The New York State Department of Environmental Conservation (the Department) has received and reviewed the Site Investigation Report dated June 8, 2004 submitted by Gannett Fleming for the above referenced site. The Department has reviewed the Plan and requires the following::

1. *Quarterly GroundWater Sampling:* As per DER-10 Technical Guidance for Site Investigation and Remediation Section 6.3.c.4.i "Sampling should be conducted on a quarterly basis at monitoring wells associated with plume management monitoring, for a minimum of eight quarters.". In accordance the Department is requiring one full year of quarterly groundwater monitoring. Upon completion of the year of monitoring, a no further action request may be submitted to the Department.

Please notify the Department upon scheduling an investigation date. If you wish to discuss this letter, please call my office at (718) 482-6364.

Sincerely,

Jeffrey Vought

Re: Quarterly Groundwater Sampling
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Vought:

This letter report documents Gannett Fleming's (GF's) quarterly groundwater sampling at 300 Maspeth Avenue, Brooklyn, New York, performed on December 29, 2004. The purpose of this investigation is to monitor petroleum impacts to groundwater at the site relative to the areas of the former underground storage tank (UST) excavation (Spill #0202804) and the southwest portion of the site (Spill #0204002) where a former Brooklyn Union Gas bulk fuel oil terminal was located. This investigation was conducted in compliance with New York State Department of Environmental Conservation (NYSDEC) requirements, based upon the results of GF's June 2004 Site Investigation Report. A site location map is provided as Figure 1.

Groundwater samples were collected on December 29, 2004 from six of the seven wells installed in December 2003. A car was parked over monitoring well MW-1 on the day of the sampling event and the well could not be accessed. Samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8021 and poly-aromatic hydrocarbons (PAHs) using EPA Method 8270 and results were compared to NYSDEC Technical and Operational Guidance Series (TOGS) Number 1.1.1 groundwater criteria. The monitoring well locations are shown on Figure 2.

Well Sampling Summary

Prior to sampling, depth to product and depth to water were measured in each well (except MW-1). Floating product was not encountered. Three to four casing volumes of groundwater were purged from wells MW-2 through MW-7 using dedicated polyethylene bailers and groundwater samples were collected immediately after each well was purged. Samples were placed in an ice-filled cooler and hand delivered to EcoTest Laboratories, Inc., North Babylon, N.Y. for analysis, all in accord with chain-of-custody protocols.

Results

Since MW-1 was not accessible, the groundwater elevation at the north end of the site could not be determined. Elevation measurements in the remaining six wells indicate that groundwater flowing from the northwest and southwest converges to the east in the southeastern portion of the site. Although the groundwater elevation at the north end of the site could not be defined, the direction of groundwater flow remains consistent with GF's June 2004 report. A site plan showing groundwater elevation contours is provided as Figure 2.

Continued . . .

No VOCs or PAHs were detected at concentrations above NYSDEC Groundwater Standards in MW-6. The following VOC and PAH compounds were detected above NYSDEC TOGS guidance values in MW-2, 3, 4, 5 and 7:

Parameter	NYSDEC TOGS Guidance Values	MW-2	MW-3	MW-4	MW-5	MW-7
VOC						
Benzene	0.7	52	4	--	--	22
Toluene	5	--	--	--	--	9
Ethylbenzene	5	--	--	--	--	7
Total Xylenes	5	--	--	--	--	32
1,2,4-Trimethylbenzene	5	--	--	--	--	16
1,3,5-Trimethylbenzene	5	--	--	--	--	6
Naphthalene (VOC)	10	62	--	--	--	200
PAH						
Naphthalene (PAH)	10	13	--	--	--	70
Phenanthrene	50	93	--	--	--	--
Pyrene	50	82	--	--	--	--
Benzo (a) anthracene	0.002	27	1	2	2	2
Chrysene	0.002	21	1	2	2	2
Benzo (b) fluoranthene	0.002	18	--	1.5	1.5	1.5
Benzo (k) fluoranthene	0.002	18	--	1.5	1.5	1.5
Benzo (a) pyrene	0.002	19	--	2	1	1
Indeno (1,2,3-cd) pyrene	0.002	7	--	--	--	--
Benzo (ghi) perylene	5	7	--	--	--	--

Note: Concentrations are micrograms per liter (µg/l).

As reported in GF's June 2004 site report, VOC and PAH compounds sampled on January 6th, 2004 were not detected in MW-3, 4, 5, and 6. Sample results from GF's December 2004 sampling round reported VOCs and PAHs detected above TOGS in wells MW-3, 4, and 5. Specific compounds are listed above.

Continued . . .

Concentrations of benzene, naphthalene, benzo (a) anthracene, and chrysene found in MW-2 in December 2004 were higher than reported in the January 2004 sample data, while the concentration of ethylbenzene was lower. There were also seven additional PAH compounds detected above TOGS that were either not detected or not found above TOGS in the June 2004 report.

Concentrations of benzene, 1,2,4-trimethylbenzene, and naphthalene in MW-7 from the December 2004 sampling round were higher compared to the January 2004 sample data, while the concentration of ethylbenzene was unchanged and the concentration of total xylenes was less. There were also two additional VOC compounds and five additional PAH compounds detected above TOGS that were either not detected or not found above TOGS in the June 2004 report.

Conclusions

The VOC data is generally consistent with that reported in the January 2004 data. Given their low solubility, the occurrence of PAH's in the December 2004 sampling round is likely representative of elevated turbidity levels observed in these samples. Due to the fine-grained soils found at the site, turbidity levels were observed at well above 50 NTU in groundwater samples.

Complete analytical results for the December 2004 sampling round and for the June 2004 site report are provided as Table 1 and Table 2 respectively for further comparison. Analytical laboratory data sheets for the December 2004 sampling round with chain-of-custody documentation are provided as Attachment A.

Please call if you have any questions.

Very truly yours,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

NOTES:
Samples analyzed by EcoTest Laboratories, Inc. of North Babylon, NY
Results reported on a dry weight basis to 2 significant figures
Concentrations shown in bold type face exceed NYSDEC Groundwater Standards

-	Compound not detected above analytical method detection limit.
VOCs	Volatile organic compounds
PAHs	Polynuclear aromatic hydrocarbons
ppb	Parts per billion (µg/l)
--	No standard established
MDL	Method Detection Limit

Re: Quarterly Groundwater Sampling
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Vought:

This letter report documents Gannett Fleming's (GF's) second quarter, 2005 groundwater sampling at 300 Maspeth Avenue, Brooklyn, New York, performed on June 9, 2005. The purpose of the sampling is to monitor petroleum impacts to groundwater at the site relative to the areas of the former underground storage tank (UST) excavation (Spill #0202804) and the southwest portion of the site (Spill #0204002) where a former Brooklyn Union Gas bulk fuel oil terminal was located. This investigation was conducted in compliance with New York State Department of Environmental Conservation (NYSDEC) requirements, based upon the results of GF's June 2004 Site Investigation Report. A site location map is provided as Figure 1.

On June 9, 2005, groundwater samples were collected from the seven monitoring wells installed at the site. Samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8021 and poly-aromatic hydrocarbons (PAHs) using EPA Method 8270 and results were compared to NYSDEC Technical and Operational Guidance Series (TOGS) Number 1.1.1 groundwater criteria. The monitoring well locations are shown on Figure 2.

Well Sampling Summary

Prior to sampling, depth to product and depth to water were measured in wells MW-2 through MW-7. MW-1 was immediately purged and sampled following depth to product and depth to water measurements to complete sampling of the well before vehicles could possibly park over it. No floating product was observed in any of the wells. Three to four casing volumes of groundwater were purged from each well using a centrifugal pump with dedicated polyethylene tubing. At the completion of each purged casing volume, pH, conductivity, temperature, and turbidity were measured and recorded in field sampling logs. Groundwater samples were collected immediately after the well was purged. Samples were placed in an ice-filled cooler and hand delivered to EcoTest Laboratories, Inc., North Babylon, New York for analysis. Samples were handled in accordance with chain-of-custody protocols.

Continued...

Results

Groundwater elevation measurements in the wells indicate that groundwater is flowing from the northwest and southwest and converges in an easterly direction. The direction of groundwater flow is consistent with the previous data collected in February 2005. A site plan showing groundwater elevation contours is provided as Figure 2.

No VOCs or PAHs were detected in MW-4, 5, and 6. The following VOC and PAH compounds were detected above NYSDEC TOGS guidance values in MW-1, 2, 3, and 7:

Parameter	NYSDEC TOGS Guidance Values	MW-1	MW-2	MW-3	MW-7
VOC					
Benzene	0.7	10	13	7	22
Toluene	5	--	--	--	7
Ethylbenzene	5	22	--	--	7
Total Xylenes	5	15	--	--	37
Isopropyl Benzene	5	7	--	--	--
1,3,5-Trimethylbenzene	5	--	--	--	6
1,2,4-Trimethylbenzene	5	27	--	--	15
Naphthalene (VOC)	10	53	--	--	110
PAH					
Naphthalene (PAH)	10	25	--	--	65

Note: Concentrations are micrograms per liter (µg/l).

VOC results from the June 2005 sampling round of MW-1 through 7 are generally consistent with the data from the February 2005 sampling round. PAH results from the June 2005 sampling round of MW-1 through 7 are also generally consistent with the previous data, with the exception of MW-3 and MW-4. In the June 2005 sample results, MW-3 and 4 have no PAH compounds at concentrations above TOGS compared to the February 2005 results, where MW-3 and 4 had six PAH compounds (benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, and indeno(1,2,3-cd)pyrene) at concentrations above TOGS.

Conclusions

The VOC data is generally consistent with that reported in the February 2005 data. Based on the results of this sampling round, Gannett Fleming has concluded the following:

Continued...

- Because of their low solubility, the absence of PAH's in wells MW-3 and 4 during the June 2005 sampling round is most likely associated with the lower turbidity levels observed. During the February 2005 sampling round, the sample turbidity level in MW-3 was observed at greater than 999 NTU, while the sample turbidity level in June 2005 was observed at 168 NTU. The turbidity readings for MW-4 were 68 NTU in February 2005 and 4.27 NTU in June 2005.

- When comparing contaminant concentrations in site wells to groundwater flow direction, it appears that groundwater contamination is stagnant.

The complete analytical summary tables for February and June 2005 sampling rounds are provided as Tables 1 and 2 respectively for further comparison. Analytical laboratory data sheets for the June 2005 sampling round with chain-of-custody documentation are provided as Attachment A.

Please call if you have any questions.

Very truly yours,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

Re: Quarterly Groundwater Sampling
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Vought:

This letter report documents Gannett Fleming's (GF's) first quarter, 2005 groundwater sampling at 300 Maspeth Avenue, Brooklyn, New York, performed on February 24, 2005. The purpose of the sampling is to monitor petroleum impacts to groundwater at the site relative to the areas of the former underground storage tank (UST) excavation (Spill #0202804) and the southwest portion of the site (Spill #0204002) where a former Brooklyn Union Gas bulk fuel oil terminal was located. This investigation was conducted in compliance with New York State Department of Environmental Conservation (NYSDEC) requirements, based upon the results of GF's June 2004 Site Investigation Report. A site location map is provided as Figure 1.

On February 24, 2005, groundwater samples were collected from the seven monitoring wells installed at the site. Samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8021 and poly-aromatic hydrocarbons (PAHs) using EPA Method 8270 and results were compared to NYSDEC Technical and Operational Guidance Series (TOGS) Number 1.1.1 groundwater criteria. The monitoring well locations are shown on Figure 2.

Well Sampling Summary

Prior to sampling, depth to product and depth to water were measured in each well. Floating product was not encountered. Three to four casing volumes of groundwater were purged from each well. MW-1, 2, and 3 were purged using a centrifugal pump with dedicated polyethylene tubing. MW-4, 5, 6, and 7 were purged using dedicated polyethylene bailers because the centrifugal pump broke down after sampling MW-3. MW-1 was purged dry after 2 well volumes and the well was allowed to recharge before sampling. Groundwater samples from the remaining wells were collected immediately after each well was purged. Samples were placed in an ice-filled cooler and hand delivered to EcoTest Laboratories, Inc., North Babylon, New York for analysis, in accordance with chain-of-custody protocols.

Results

Groundwater elevation measurements in the wells indicate that groundwater is flowing from the northwest and southwest and converges in an easterly direction. The direction of groundwater flow remains consistent with the data provided in GF's January and December 2004 reports. A site plan showing groundwater elevation contours is provided as Figure 2.

Continued...

No VOCs or PAHs were detected in MW-5 and 6. The following VOC and PAH compounds were detected above NYSDEC TOGS guidance values in MW-1, 2, 3, 4, and 7:

Parameter	NYSDEC TOGS Guidance Values	MW-1	MW-2	MW-3	MW-4	MW-7
VOC						
Benzene	0.7	6	4	6	--	16
Toluene	5	--	--	--	--	7
Ethylbenzene	5	25	--	--	--	7
Total Xylenes	5	11	--	--	--	42
Isopropyl Benzene	5	7	--	--	--	--
1,2,4-Trimethylbenzene	5	21	--	--	--	16
Naphthalene (VOC)	10	45	--	--	--	97
PAH						
Naphthalene (PAH)	10	12	--	--	--	45
Benzo (a) anthracene	0.002	--	--	7	3	--
Chrysene	0.002	--	--	7	3	--
Benzo (b) fluoranthene	0.002	--	--	6	2	--
Benzo (k) fluoranthene	0.002	--	--	6	2	--
Benzo (a) pyrene	0.002	--	--	5	3	--
Indeno (1,2,3-cd) pyrene	0.002	--	--	3	1	--

Note: Concentrations are micrograms per liter (µg/l).

VOC results from the February 2005 sampling round of MW-2 through 7 are generally consistent with the previous data with the exception of the concentration of naphthalene in MW-2 and 7. Naphthalene in MW-2 has fallen from 62 µg/kg to not detected, and in MW-7 naphthalene has fallen from 200 µg/kg to 97 µg/kg. PAH results from the February 2005 sampling round of MW-2 through 7 are also consistent with the previous data, with the exception of MW-2. In the December 2004 sample results, MW-2 had ten PAH compounds above TOGS compared to the February 2004 results, where there are no compounds above TOGS.

MW-1 was inaccessible and not sampled in December 2004, however, compared to sample results of the January 2004 sampling round, five additional VOCs were detected above TOGS. In addition, the concentration of 1,3,5-Trimethylbenzene, has fallen below TOGS, total xylenes has decreased slightly, and the concentration of naphthalene (PAH) has fallen significantly from 97 µg/kg to 12 µg/kg.

Continued...

Conclusions

The VOC data is generally consistent with that reported in the January and December 2004 data. Based on the results of this sampling round, Gannett Fleming has concluded the following:

- The five new compounds detected above TOGS in MW-1 are at concentrations only slightly exceeding TOGS. Three compounds in MW-1 with concentrations above TOGS in January 2004 have decreased significantly, with two of them now below TOGS. This data appears consistent with regional characteristic groundwater quality and does not represent a localized groundwater issue in the vicinity of this well.
- Because of their low solubility, the occurrence of higher concentrations of PAH's in MW-2 in December 2004 is likely representative of elevated turbidity levels observed. Turbidity levels in MW-2 were observed at greater than 999 NTU in groundwater samples during that sampling round. During the February 2005 sampling round, MW-2 was purged with a centrifugal pump instead of a bailer, which facilitated a sample turbidity level of 3.28 NTU.
- When comparing contaminant concentrations in site wells to groundwater flow directio appears that groundwater contamination is stagnant.

The complete analytical summary tables for February 2005, December 2004, and January 2004 sa rounds are provided as Table 1, 2, and 3 respectively for further comparison. Analytical laborat sheets for the February 2005 sampling round with chain-of-custody documentation are pro Attachment A.

Re: 3rd Quarter 2005 Groundwater Sampling and Groundwater Investigation Final Report
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Obligado:

This letter report documents Gannett Fleming's (GF's) third quarter 2005 groundwater sampling at 300 Maspeth Avenue, Brooklyn, New York. This letter report also concludes four sampling rounds performed to monitor groundwater quality (December 29, 2004, February 24, 2005, June 9, 2005, and September 28, 2005). The purpose of the groundwater monitoring is to evaluate petroleum impacts in groundwater relative to the areas of the former underground storage tank (UST) excavation (Spill #0202804) and the southwest portion of the site (Spill #0204002) where a former Brooklyn Union Gas bulk fuel oil terminal was located. This investigation was conducted in compliance with New York State Department of Environmental Conservation (NYSDEC) requirements, based upon the results of GF's June 2004 Site Investigation Report. A site location map is provided as Figure 1.

September 28, 2005 Groundwater Sampling

On September 28, 2005, groundwater samples were collected from six of the seven monitoring wells installed at the site. Well MW-2 was covered by stockpiled concrete jersey barriers and therefore inaccessible. Samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8260 and poly-aromatic hydrocarbons (PAHs) using EPA Method 8270 and results were compared to NYSDEC Technical and Operational Guidance Series (TOGS) Number 1.1.1 groundwater criteria. The monitoring well locations are shown on Figure 2.

Well Sampling Summary

Prior to sampling, depth to product and depth to water were measured in wells MW-1 through MW-7, excluding MW-2. No floating product was observed in any of the wells. Prior to sampling, three to four casing volumes of groundwater were purged from each well using a centrifugal pump with dedicated polyethylene tubing. At the completion of each purged casing volume, pH, conductivity, temperature, and turbidity were measured and recorded in field sampling logs. Groundwater samples were collected immediately after the well was purged. Samples were placed in an ice-filled cooler and hand delivered to EcoTest Laboratories, Inc.,

North Babylon, New York for analysis. Samples were handled in accordance with chain-of-custody protocols.

Results

Groundwater elevation measurements in the wells indicate that groundwater is flowing from the northwest and southwest and converges in an easterly direction. The direction of groundwater flow remains consistent with the previous data collected in June 2005. A site plan showing groundwater elevation contours is provided as Figure 2.

Neither VOCs nor PAHs were detected in MW-4, 5, and 6. MW-2 was not sampled. The following VOC and PAH compounds were detected above NYSDEC TOGS guidance values in MW-1, 3, and 7:

Parameter	NYSDEC TOGS Guidance Values	MW-1	MW-3	MW-7
VOC				
Benzene	0.7	28	3	34
Toluene	5	--	--	6
Ethylbenzene	5	28	--	--
Total Xylenes	5	10	--	32
Isopropyl Benzene	5	12	--	--
1,3,5-Trimethylbenzene	5	--	--	--
1,2,4-Trimethylbenzene	5	16	--	14
Naphthalene (VOC)	10	34	--	150
PAH				
Naphthalene (PAH)	10	17	--	95

Note: Concentrations are micrograms per liter (µg/l).

VOC and PAH analytical results from the September 2005 sampling round of MW-1 through 7 (excluding MW-2) are consistent with the data from the June 2005 sampling round. The largest variations in concentrations are benzene in MW-1, which increased by 18 parts-per-billion (ppb) in September 2005 and naphthalene in MW-7, which increased by 40 ppb in September 2005.

Conclusions

The VOC and PAH data is consistent with that reported in the June 2005 data. Based on the results of this sampling round, Gannett Fleming has concluded the following:

Continued . . .

- The groundwater data collected in site wells indicate groundwater contamination is stagnant. Groundwater flow and quality have remained consistent throughout the monitoring program.

- Although MW-2 was not accessed during the September 2005 sampling round, MW-2 sample results from the February and June 2005 sampling rounds are consistent. Groundwater quality over the entire site has remained unchanged during the monitoring program, therefore it is likely that VOC and PAH concentrations in MW-2 have not significantly fluctuated since the June 2005 sampling round.

The complete analytical summary table for the December 2004, February, June and September 2005 sampling rounds is provided as Table 1 for further comparison. Analytical laboratory data sheets for the September 2005 sampling round with chain-of-custody documentation are provided as Attachment A.

Groundwater Investigation Final Conclusions

Gannett Fleming conducted four sampling rounds on December 29, 2004, February 24, 2005, June 9, 2005, and September 28, 2005. Upon each sampling round, groundwater VOC and PAH concentrations were monitored and depth to water measurements were collected to gauge groundwater flow direction in each of the seven wells. The analytical results from each sampling round were evaluated against previously collected data from the site dating back to January 2004 to identify trends or variations in groundwater quality and flow. This information would determine if the petroleum contamination originated on-site or emanated from regional impacts and indicate migration of contaminants off-site.

Results

Groundwater elevation measurements throughout the four quarters consistently indicated that groundwater is flowing from the northwest and southwest and converges in an easterly direction. A site plan showing well locations and groundwater elevation contours is provided as Figure 2. :

Based on the data collected during this investigation, it appears that groundwater contamination impacts at the site are stagnant. Fluctuations in VOC and PAH concentrations throughout the investigation are consistent with seasonal variations. No significant changes have been observed to the analytical characteristics of the groundwater within each well. Furthermore, VOCs and PAHs were not detected above TOGS in the most down gradient well, MW-6, and in down gradient well MW-5 during the entire groundwater investigation.

The stagnant groundwater contaminant plume indicated groundwater impacts are representative of regional groundwater quality. If the UST and historic petroleum storage area were a source of

Continued . . .

groundwater contamination, the removal of impacted soil from these areas should have shown evidence of an improvement in groundwater quality. This was not the case. Therefore, GF requests that NYSDEC Spill #0202804 and #0204002 be closed.

Please call if you have any questions.

Very truly yours,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

RE: Spill # 0202804 and #0204002
300 Maspeth Avenue
Brooklyn, NY

Dear Mr. Swart,

Based on the submitted documentation provided to date, no further investigation or response will be required concerning this site, with regard to the spill number referenced above. The NYS DEC spill numbers **0202804 and 0204002** have been inactivated.

The Department hereby reserves all of its rights concerning, and such forbearance shall not extend to, any further investigation or remedial action the Department deems necessary due to:

I. The off-site migration of petroleum contaminants that was not addressed by this evaluation.
II. Environmental conditions related to the Site which were unknown to the Department at the time of this approval.
III. Information received, in whole or part, after the Department's approval for inactivation, which indicates that inactivation decision and/or corrective action is not sufficiently protective of human health for the reasonably anticipated use of the site.
IV. Fraud in obtaining this approval for inactivation.

Please be advised that you should maintain a permanent file of all documentation and correspondence regarding this case for future property transactions, refinancing, etc. The Department's files regarding this release may not be maintained indefinitely.

Sincerely,

Andre Obligado
Engineering Geologist
NYSDEC Region 2

Re: 300 Maspeth Avenue, Brooklyn, NY
Spill #: 0202804

Dear Mr. Swart:

The New York State Department of Environmental Conservation (the Department) has received and reviewed the Site Investigation Report dated June 8, 2004 submitted by Gannett Fleming for the above referenced site. The Department has reviewed the Plan and requires the following::

1. *Quarterly GroundWater Sampling:* As per DER-10 Technical Guidance for Site Investigation and Remediation Section 6.3.c.4.i "Sampling should be conducted on a quarterly basis at monitoring wells associated with plume management monitoring, for a minimum of eight quarters.". In accordance the Department is requiring one full year of quarterly groundwater monitoring. Upon completion of the year of monitoring, a no further action request may be submitted to the Department.

Please notify the Department upon scheduling an investigation date. If you wish to discuss this letter, please call my office at (718) 482-6364.

Sincerely,

Jeffrey Vought

Re: 3rd Quarter 2005 Groundwater Sampling and Groundwater Investigation Final Report
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Obligado:

This letter report documents Gannett Fleming's (GF's) third quarter 2005 groundwater sampling at 300 Maspeth Avenue, Brooklyn, New York. This letter report also concludes four sampling rounds performed to monitor groundwater quality (December 29, 2004, February 24, 2005, June 9, 2005, and September 28, 2005). The purpose of the groundwater monitoring is to evaluate petroleum impacts in groundwater relative to the areas of the former underground storage tank (UST) excavation (Spill #0202804) and the southwest portion of the site (Spill #0204002) where a former Brooklyn Union Gas bulk fuel oil terminal was located. This investigation was conducted in compliance with New York State Department of Environmental Conservation (NYSDEC) requirements, based upon the results of GF's June 2004 Site Investigation Report. A site location map is provided as Figure 1.

September 28, 2005 Groundwater Sampling

On September 28, 2005, groundwater samples were collected from six of the seven monitoring wells installed at the site. Well MW-2 was covered by stockpiled concrete jersey barriers and therefore inaccessible. Samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8260 and poly-aromatic hydrocarbons (PAHs) using EPA Method 8270 and results were compared to NYSDEC Technical and Operational Guidance Series (TOGS) Number 1.1.1 groundwater criteria. The monitoring well locations are shown on Figure 2.

Well Sampling Summary

Prior to sampling, depth to product and depth to water were measured in wells MW-1 through MW-7, excluding MW-2. No floating product was observed in any of the wells. Prior to sampling, three to four casing volumes of groundwater were purged from each well using a centrifugal pump with dedicated polyethylene tubing. At the completion of each purged casing volume, pH, conductivity, temperature, and turbidity were measured and recorded in field sampling logs. Groundwater samples were collected immediately after the well was purged. Samples were placed in an ice-filled cooler and hand delivered to EcoTest Laboratories, Inc.,

North Babylon, New York for analysis. Samples were handled in accordance with chain-of-custody protocols.

Results

Groundwater elevation measurements in the wells indicate that groundwater is flowing from the northwest and southwest and converges in an easterly direction. The direction of groundwater flow remains consistent with the previous data collected in June 2005. A site plan showing groundwater elevation contours is provided as Figure 2.

Neither VOCs nor PAHs were detected in MW-4, 5, and 6. MW-2 was not sampled. The following VOC and PAH compounds were detected above NYSDEC TOGS guidance values in MW-1, 3, and 7:

Parameter	NYSDEC TOGS Guidance Values	MW-1	MW-3	MW-7
VOC				
Benzene	0.7	28	3	34
Toluene	5	--	--	6
Ethylbenzene	5	28	--	--
Total Xylenes	5	10	--	32
Isopropyl Benzene	5	12	--	--
1,3,5-Trimethylbenzene	5	--	--	--
1,2,4-Trimethylbenzene	5	16	--	14
Naphthalene (VOC)	10	34	--	150
PAH				
Naphthalene (PAH)	10	17	--	95

Note: Concentrations are micrograms per liter (µg/l).

VOC and PAH analytical results from the September 2005 sampling round of MW-1 through 7 (excluding MW-2) are consistent with the data from the June 2005 sampling round. The largest variations in concentrations are benzene in MW-1, which increased by 18 parts-per-billion (ppb) in September 2005 and naphthalene in MW-7, which increased by 40 ppb in September 2005.

Conclusions

The VOC and PAH data is consistent with that reported in the June 2005 data. Based on the results of this sampling round, Gannett Fleming has concluded the following:

Continued . . .

printed on recycled paper

- The groundwater data collected in site wells indicate groundwater contamination is stagnant. Groundwater flow and quality have remained consistent throughout the monitoring program.

- Although MW-2 was not accessed during the September 2005 sampling round, MW-2 sample results from the February and June 2005 sampling rounds are consistent. Groundwater quality over the entire site has remained unchanged during the monitoring program, therefore it is likely that VOC and PAH concentrations in MW-2 have not significantly fluctuated since the June 2005 sampling round.

The complete analytical summary table for the December 2004, February, June and September 2005 sampling rounds is provided as Table 1 for further comparison. Analytical laboratory data sheets for the September 2005 sampling round with chain-of-custody documentation are provided as Attachment A.

Groundwater Investigation Final Conclusions

Gannett Fleming conducted four sampling rounds on December 29, 2004, February 24, 2005, June 9, 2005, and September 28, 2005. Upon each sampling round, groundwater VOC and PAH concentrations were monitored and depth to water measurements were collected to gauge groundwater flow direction in each of the seven wells. The analytical results from each sampling round were evaluated against previously collected data from the site dating back to January 2004 to identify trends or variations in groundwater quality and flow. This information would determine if the petroleum contamination originated on-site or emanated from regional impacts and indicate migration of contaminants off-site.

Results

Groundwater elevation measurements throughout the four quarters consistently indicated that groundwater is flowing from the northwest and southwest and converges in an easterly direction. A site plan showing well locations and groundwater elevation contours is provided as Figure 2. :

Based on the data collected during this investigation, it appears that groundwater contamination impacts at the site are stagnant. Fluctuations in VOC and PAH concentrations throughout the investigation are consistent with seasonal variations. No significant changes have been observed to the analytical characteristics of the groundwater within each well. Furthermore, VOCs and PAHs were not detected above TOGS in the most down gradient well, MW-6, and in down gradient well MW-5 during the entire groundwater investigation.

The stagnant groundwater contaminant plume indicated groundwater impacts are representative of regional groundwater quality. If the UST and historic petroleum storage area were a source of

Continued . . .

printed on recycled paper

groundwater contamination, the removal of impacted soil from these areas should have shown evidence of an improvement in groundwater quality. This was not the case. Therefore, GF requests that NYSDEC Spill #0202804 and #0204002 be closed.

Please call if you have any questions.

Very truly yours,

Re: 300 Maspeth Avenue, Brooklyn, NY
Spill #: 0202804

Dear Mr. Swart:

The New York State Department of Environmental Conservation (the Department) has received and reviewed the Site Investigation Report dated June 8, 2004 submitted by Gannett Fleming for the above referenced site. The Department has reviewed the Plan and requires the following::

1. *Quarterly GroundWater Sampling:* As per DER-10 Technical Guidance for Site Investigation and Remediation Section 6.3.c.4.i "Sampling should be conducted on a quarterly basis at monitoring wells associated with plume management monitoring, for a minimum of eight quarters.". In accordance the Department is requiring one full year of quarterly groundwater monitoring. Upon completion of the year of monitoring, a no further action request may be submitted to the Department.

Please notify the Department upon scheduling an investigation date. If you wish to discuss this letter, please call my office at (718) 482-6364.

Sincerely,

Jeffrey Vought

Re: 3rd Quarter 2005 Groundwater Sampling and Groundwater Investigation Final Report
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Obligado:

This letter report documents Gannett Fleming's (GF's) third quarter 2005 groundwater sampling at 300 Maspeth Avenue, Brooklyn, New York. This letter report also concludes four sampling rounds performed to monitor groundwater quality (December 29, 2004, February 24, 2005, June 9, 2005, and September 28, 2005). The purpose of the groundwater monitoring is to evaluate petroleum impacts in groundwater relative to the areas of the former underground storage tank (UST) excavation (Spill #0202804) and the southwest portion of the site (Spill #0204002) where a former Brooklyn Union Gas bulk fuel oil terminal was located. This investigation was conducted in compliance with New York State Department of Environmental Conservation (NYSDEC) requirements, based upon the results of GF's June 2004 Site Investigation Report. A site location map is provided as Figure 1.

September 28, 2005 Groundwater Sampling

On September 28, 2005, groundwater samples were collected from six of the seven monitoring wells installed at the site. Well MW-2 was covered by stockpiled concrete jersey barriers and therefore inaccessible. Samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8260 and poly-aromatic hydrocarbons (PAHs) using EPA Method 8270 and results were compared to NYSDEC Technical and Operational Guidance Series (TOGS) Number 1.1.1 groundwater criteria. The monitoring well locations are shown on Figure 2.

Well Sampling Summary

Prior to sampling, depth to product and depth to water were measured in wells MW-1 through MW-7, excluding MW-2. No floating product was observed in any of the wells. Prior to sampling, three to four casing volumes of groundwater were purged from each well using a centrifugal pump with dedicated polyethylene tubing. At the completion of each purged casing volume, pH, conductivity, temperature, and turbidity were measured and recorded in field sampling logs. Groundwater samples were collected immediately after the well was purged. Samples were placed in an ice-filled cooler and hand delivered to EcoTest Laboratories, Inc.,

printed on recycled paper

North Babylon, New York for analysis. Samples were handled in accordance with chain-of-custody protocols.

Results

Groundwater elevation measurements in the wells indicate that groundwater is flowing from the northwest and southwest and converges in an easterly direction. The direction of groundwater flow remains consistent with the previous data collected in June 2005. A site plan showing groundwater elevation contours is provided as Figure 2.

Neither VOCs nor PAHs were detected in MW-4, 5, and 6. MW-2 was not sampled. The following VOC and PAH compounds were detected above NYSDEC TOGS guidance values in MW-1, 3, and 7:

Parameter	NYSDEC TOGS Guidance Values	MW-1	MW-3	MW-7
VOC				
Benzene	0.7	28	3	34
Toluene	5	--	--	6
Ethylbenzene	5	28	--	--
Total Xylenes	5	10	--	32
Isopropyl Benzene	5	12	--	--
1,3,5-Trimethylbenzene	5	--	--	--
1,2,4-Trimethylbenzene	5	16	--	14
Naphthalene (VOC)	10	34	--	150
PAH				
Naphthalene (PAH)	10	17	--	95

Note: Concentrations are micrograms per liter (µg/l).

VOC and PAH analytical results from the September 2005 sampling round of MW-1 through 7 (excluding MW-2) are consistent with the data from the June 2005 sampling round. The largest variations in concentrations are benzene in MW-1, which increased by 18 parts-per-billion (ppb) in September 2005 and naphthalene in MW-7, which increased by 40 ppb in September 2005.

Conclusions

The VOC and PAH data is consistent with that reported in the June 2005 data. Based on the results of this sampling round, Gannett Fleming has concluded the following:

Continued . . .

printed on recycled paper

- The groundwater data collected in site wells indicate groundwater contamination is stagnant. Groundwater flow and quality have remained consistent throughout the monitoring program.

- Although MW-2 was not accessed during the September 2005 sampling round, MW-2 sample results from the February and June 2005 sampling rounds are consistent. Groundwater quality over the entire site has remained unchanged during the monitoring program, therefore it is likely that VOC and PAH concentrations in MW-2 have not significantly fluctuated since the June 2005 sampling round.

The complete analytical summary table for the December 2004, February, June and September 2005 sampling rounds is provided as Table 1 for further comparison. Analytical laboratory data sheets for the September 2005 sampling round with chain-of-custody documentation are provided as Attachment A.

Groundwater Investigation Final Conclusions

Gannett Fleming conducted four sampling rounds on December 29, 2004, February 24, 2005, June 9, 2005, and September 28, 2005. Upon each sampling round, groundwater VOC and PAH concentrations were monitored and depth to water measurements were collected to gauge groundwater flow direction in each of the seven wells. The analytical results from each sampling round were evaluated against previously collected data from the site dating back to January 2004 to identify trends or variations in groundwater quality and flow. This information would determine if the petroleum contamination originated on-site or emanated from regional impacts and indicate migration of contaminants off-site.

Results

Groundwater elevation measurements throughout the four quarters consistently indicated that groundwater is flowing from the northwest and southwest and converges in an easterly direction. A site plan showing well locations and groundwater elevation contours is provided as Figure 2. :

Based on the data collected during this investigation, it appears that groundwater contamination impacts at the site are stagnant. Fluctuations in VOC and PAH concentrations throughout the investigation are consistent with seasonal variations. No significant changes have been observed to the analytical characteristics of the groundwater within each well. Furthermore, VOCs and PAHs were not detected above TOGS in the most down gradient well, MW-6, and in down gradient well MW-5 during the entire groundwater investigation.

The stagnant groundwater contaminant plume indicated groundwater impacts are representative of regional groundwater quality. If the UST and historic petroleum storage area were a source of

Continued . . .

printed on recycled paper

groundwater contamination, the removal of impacted soil from these areas should have shown evidence of an improvement in groundwater quality. This was not the case. Therefore, GF requests that NYSDEC Spill #0202804 and #0204002 be closed.

Please call if you have any questions.

Very truly yours,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

Re: Quarterly Groundwater Sampling
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Vought:

This letter report documents Gannett Fleming's (GF's) second quarter, 2005 groundwater sampling at 300 Maspeth Avenue, Brooklyn, New York, performed on June 9, 2005. The purpose of the sampling is to monitor petroleum impacts to groundwater at the site relative to the areas of the former underground storage tank (UST) excavation (Spill #0202804) and the southwest portion of the site (Spill #0204002) where a former Brooklyn Union Gas bulk fuel oil terminal was located. This investigation was conducted in compliance with New York State Department of Environmental Conservation (NYSDEC) requirements, based upon the results of GF's June 2004 Site Investigation Report. A site location map is provided as Figure 1.

On June 9, 2005, groundwater samples were collected from the seven monitoring wells installed at the site. Samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8021 and poly-aromatic hydrocarbons (PAHs) using EPA Method 8270 and results were compared to NYSDEC Technical and Operational Guidance Series (TOGS) Number 1.1.1 groundwater criteria. The monitoring well locations are shown on Figure 2.

Well Sampling Summary

Prior to sampling, depth to product and depth to water were measured in wells MW-2 through MW-7. MW-1 was immediately purged and sampled following depth to product and depth to water measurements to complete sampling of the well before vehicles could possibly park over it. No floating product was observed in any of the wells. Three to four casing volumes of groundwater were purged from each well using a centrifugal pump with dedicated polyethylene tubing. At the completion of each purged casing volume, pH, conductivity, temperature, and turbidity were measured and recorded in field sampling logs. Groundwater samples were collected immediately after the well was purged. Samples were placed in an ice-filled cooler and hand delivered to EcoTest Laboratories, Inc., North Babylon, New York for analysis. Samples were handled in accordance with chain-of-custody protocols.

Continued...

Results

Groundwater elevation measurements in the wells indicate that groundwater is flowing from the northwest and southwest and converges in an easterly direction. The direction of groundwater flow is consistent with the previous data collected in February 2005. A site plan showing groundwater elevation contours is provided as Figure 2.

No VOCs or PAHs were detected in MW-4, 5, and 6. The following VOC and PAH compounds were detected above NYSDEC TOGS guidance values in MW-1, 2, 3, and 7:

Parameter	NYSDEC TOGS Guidance Values	MW-1	MW-2	MW-3	MW-7
VOC					
Benzene	0.7	10	13	7	22
Toluene	5	--	--	--	7
Ethylbenzene	5	22	--	--	7
Total Xylenes	5	15	--	--	37
Isopropyl Benzene	5	7	--	--	--
1,3,5-Trimethylbenzene	5	--	--	--	6
1,2,4-Trimethylbenzene	5	27	--	--	15
Naphthalene (VOC)	10	53	--	--	110
PAH					
Naphthalene (PAH)	10	25	--	--	65

Note: Concentrations are micrograms per liter (µg/l).

VOC results from the June 2005 sampling round of MW-1 through 7 are generally consistent with the data from the February 2005 sampling round. PAH results from the June 2005 sampling round of MW-1 through 7 are also generally consistent with the previous data, with the exception of MW-3 and MW-4. In the June 2005 sample results, MW-3 and 4 have no PAH compounds at concentrations above TOGS compared to the February 2005 results, where MW-3 and 4 had six PAH compounds (benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, and indeno(1,2,3-cd)pyrene) at concentrations above TOGS.

Conclusions

The VOC data is generally consistent with that reported in the February 2005 data. Based on the results of this sampling round, Gannett Fleming has concluded the following:

Continued...

- Because of their low solubility, the absence of PAH's in wells MW-3 and 4 during the June 2005 sampling round is most likely associated with the lower turbidity levels observed. During the February 2005 sampling round, the sample turbidity level in MW-3 was observed at greater than 999 NTU, while the sample turbidity level in June 2005 was observed at 168 NTU. The turbidity readings for MW-4 were 68 NTU in February 2005 and 4.27 NTU in June 2005.

- When comparing contaminant concentrations in site wells to groundwater flow direction, it appears that groundwater contamination is stagnant.

The complete analytical summary tables for February and June 2005 sampling rounds are provided as Tables 1 and 2 respectively for further comparison. Analytical laboratory data sheets for the June 2005 sampling round with chain-of-custody documentation are provided as Attachment A.

Please call if you have any questions.

Very truly yours,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

Re: Quarterly Groundwater Sampling
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Vought:

This letter report documents Gannett Fleming's (GF's) first quarter, 2005 groundwater sampling at 300 Maspeth Avenue, Brooklyn, New York, performed on February 24, 2005. The purpose of the sampling is to monitor petroleum impacts to groundwater at the site relative to the areas of the former underground storage tank (UST) excavation (Spill #0202804) and the southwest portion of the site (Spill #0204002) where a former Brooklyn Union Gas bulk fuel oil terminal was located. This investigation was conducted in compliance with New York State Department of Environmental Conservation (NYSDEC) requirements, based upon the results of GF's June 2004 Site Investigation Report. A site location map is provided as Figure 1.

On February 24, 2005, groundwater samples were collected from the seven monitoring wells installed at the site. Samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8021 and poly-aromatic hydrocarbons (PAHs) using EPA Method 8270 and results were compared to NYSDEC Technical and Operational Guidance Series (TOGS) Number 1.1.1 groundwater criteria. The monitoring well locations are shown on Figure 2.

Well Sampling Summary

Prior to sampling, depth to product and depth to water were measured in each well. Floating product was not encountered. Three to four casing volumes of groundwater were purged from each well. MW-1, 2, and 3 were purged using a centrifugal pump with dedicated polyethylene tubing. MW-4, 5, 6, and 7 were purged using dedicated polyethylene bailers because the centrifugal pump broke down after sampling MW-3. MW-1 was purged dry after 2 well volumes and the well was allowed to recharge before sampling. Groundwater samples from the remaining wells were collected immediately after each well was purged. Samples were placed in an ice-filled cooler and hand delivered to EcoTest Laboratories, Inc., North Babylon, New York for analysis, in accordance with chain-of-custody protocols.

Results

Groundwater elevation measurements in the wells indicate that groundwater is flowing from the northwest and southwest and converges in an easterly direction. The direction of groundwater flow remains consistent with the data provided in GF's January and December 2004 reports. A site plan showing groundwater elevation contours is provided as Figure 2.

printed on recycled paper

No VOCs or PAHs were detected in MW-5 and 6. The following VOC and PAH compounds were detected above NYSDEC TOGS guidance values in MW-1, 2, 3, 4, and 7:

Parameter	NYSDEC TOGS Guidance Values	MW-1	MW-2	MW-3	MW-4	MW-7
VOC						
Benzene	0.7	6	4	6	--	16
Toluene	5	--	--	--	--	7
Ethylbenzene	5	25	--	--	--	7
Total Xylenes	5	11	--	--	--	42
Isopropyl Benzene	5	7	--	--	--	--
1,2,4-Trimethylbenzene	5	21	--	--	--	16
Naphthalene (VOC)	10	45	--	--	--	97
PAH						
Naphthalene (PAH)	10	12	--	--	--	45
Benzo (a) anthracene	0.002	--	--	7	3	--
Chrysene	0.002	--	--	7	3	--
Benzo (b) fluoranthene	0.002	--	--	6	2	--
Benzo (k) fluoranthene	0.002	--	--	6	2	--
Benzo (a) pyrene	0.002	--	--	5	3	--
Indeno (1,2,3-cd) pyrene	0.002	--	--	3	1	--

Note: Concentrations are micrograms per liter (µg/l).

VOC results from the February 2005 sampling round of MW-2 through 7 are generally consistent with the previous data with the exception of the concentration of naphthalene in MW-2 and 7. Naphthalene in MW-2 has fallen from 62 µg/kg to not detected, and in MW-7 naphthalene has fallen from 200 µg/kg to 97 µg/kg. PAH results from the February 2005 sampling round of MW-2 through 7 are also consistent with the previous data, with the exception of MW-2. In the December 2004 sample results, MW-2 had ten PAH compounds above TOGS compared to the February 2004 results, where there are no compounds above TOGS.

MW-1 was inaccessible and not sampled in December 2004, however, compared to sample results of the January 2004 sampling round, five additional VOCs were detected above TOGS. In addition, the concentration of 1,3,5-Trimethylbenzene, has fallen below TOGS, total xylenes has decreased slightly, and the concentration of naphthalene (PAH) has fallen significantly from 97 µg/kg to 12 µg/kg.

Continued...

Conclusions

The VOC data is generally consistent with that reported in the January and December 2004 data. Based on the results of this sampling round, Gannett Fleming has concluded the following:

- The five new compounds detected above TOGS in MW-1 are at concentrations only slightly exceeding TOGS. Three compounds in MW-1 with concentrations above TOGS in January 2004 have decreased significantly, with two of them now below TOGS. This data appears consistent with regional characteristic groundwater quality and does not represent a localized groundwater issue in the vicinity of this well.
- Because of their low solubility, the occurrence of higher concentrations of PAH's in MW-2 in December 2004 is likely representative of elevated turbidity levels observed. Turbidity levels in MW-2 were observed at greater than 999 NTU in groundwater samples during that sampling round. During the February 2005 sampling round, MW-2 was purged with a centrifugal pump instead of a bailer, which facilitated a sample turbidity level of 3.28 NTU.
- When comparing contaminant concentrations in site wells to groundwater flow direction, it appears that groundwater contamination is stagnant.

The complete analytical summary tables for February 2005, December 2004, and January 2004 sampl rounds are provided as Table 1, 2, and 3 respectively for further comparison. Analytical laboratory sheets for the February 2005 sampling round with chain-of-custody documentation are provid Attachment A.

Re: Quarterly Groundwater Sampling
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Vought:

This letter report documents Gannett Fleming's (GF's) quarterly groundwater sampling at 300 Maspeth Avenue, Brooklyn, New York, performed on December 29, 2004. The purpose of this investigation is to monitor petroleum impacts to groundwater at the site relative to the areas of the former underground storage tank (UST) excavation (Spill #0202804) and the southwest portion of the site (Spill #0204002) where a former Brooklyn Union Gas bulk fuel oil terminal was located. This investigation was conducted in compliance with New York State Department of Environmental Conservation (NYSDEC) requirements, based upon the results of GF's June 2004 Site Investigation Report. A site location map is provided as Figure 1.

Groundwater samples were collected on December 29, 2004 from six of the seven wells installed in December 2003. A car was parked over monitoring well MW-1 on the day of the sampling event and the well could not be accessed. Samples were analyzed for volatile organic compounds (VOCs) using EPA Method 8021 and poly-aromatic hydrocarbons (PAHs) using EPA Method 8270 and results were compared to NYSDEC Technical and Operational Guidance Series (TOGS) Number 1.1.1 groundwater criteria. The monitoring well locations are shown on Figure 2.

Well Sampling Summary

Prior to sampling, depth to product and depth to water were measured in each well (except MW-1). Floating product was not encountered. Three to four casing volumes of groundwater were purged from wells MW-2 through MW-7 using dedicated polyethylene bailers and groundwater samples were collected immediately after each well was purged. Samples were placed in an ice-filled cooler and hand delivered to EcoTest Laboratories, Inc., North Babylon, N.Y. for analysis, all in accord with chain-of-custody protocols.

Results

Since MW-1 was not accessible, the groundwater elevation at the north end of the site could not be determined. Elevation measurements in the remaining six wells indicate that groundwater flowing from the northwest and southwest converges to the east in the southeastern portion of the site. Although the groundwater elevation at the north end of the site could not be defined, the direction of groundwater flow remains consistent with GF's June 2004 report. A site plan showing groundwater elevation contours is provided as Figure 2.

Continued . . .

No VOCs or PAHs were detected at concentrations above NYSDEC Groundwater Standards in MW-6. The following VOC and PAH compounds were detected above NYSDEC TOGS guidance values in MW-2, 3, 4, 5 and 7:

Parameter	NYSDEC TOGS Guidance Values	MW-2	MW-3	MW-4	MW-5	MW-7
VOC						
Benzene	0.7	52	4	--	--	22
Toluene	5	--	--	--	--	9
Ethylbenzene	5	--	--	--	--	7
Total Xylenes	5	--	--	--	--	32
1,2,4-Trimethylbenzene	5	--	--	--	--	16
1,3,5-Trimethylbenzene	5	--	--	--	--	6
Naphthalene (VOC)	10	62	--	--	--	200
PAH						
Naphthalene (PAH)	10	13	--	--	--	70
Phenanthrene	50	93	--	--	--	--
Pyrene	50	82	--	--	--	--
Benzo (a) anthracene	0.002	27	1	2	2	2
Chrysene	0.002	21	1	2	2	2
Benzo (b) fluoranthene	0.002	18	--	1.5	1.5	1.5
Benzo (k) fluoranthene	0.002	18	--	1.5	1.5	1.5
Benzo (a) pyrene	0.002	19	--	2	1	1
Indeno (1,2,3-cd) pyrene	0.002	7	--	--	--	--
Benzo (ghi) perylene	5	7	--	--	--	--

Note: Concentrations are micrograms per liter (µg/l).

As reported in GF's June 2004 site report, VOC and PAH compounds sampled on January 6th, 2004 were not detected in MW-3, 4, 5, and 6. Sample results from GF's December 2004 sampling round reported VOCs and PAHs detected above TOGS in wells MW-3, 4, and 5. Specific compounds are listed above.

Continued . . .

Concentrations of benzene, naphthalene, benzo (a) anthracene, and chrysene found in MW-2 in December 2004 were higher than reported in the January 2004 sample data, while the concentration of ethylbenzene was lower. There were also seven additional PAH compounds detected above TOGS that were either not detected or not found above TOGS in the June 2004 report.

Concentrations of benzene, 1,2,4-trimethylbenzene, and naphthalene in MW-7 from the December 2004 sampling round were higher compared to the January 2004 sample data, while the concentration of ethylbenzene was unchanged and the concentration of total xylenes was less. There were also two additional VOC compounds and five additional PAH compounds detected above TOGS that were either not detected or not found above TOGS in the June 2004 report.

Conclusions

The VOC data is generally consistent with that reported in the January 2004 data. Given their low solubility, the occurrence of PAH's in the December 2004 sampling round is likely representative of elevated turbidity levels observed in these samples. Due to the fine-grained soils found at the site, turbidity levels were observed at well above 50 NTU in groundwater samples.

Complete analytical results for the December 2004 sampling round and for the June 2004 site report are provided as Table 1 and Table 2 respectively for further comparison. Analytical laboratory data sheets for the December 2004 sampling round with chain-of-custody documentation are provided as Attachment A.

Please call if you have any questions.

Very truly yours,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

Re: FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804

Dear Mr. Vought:

On behalf of FedEx Ground, Gannett Fleming is submitting the letter report, which provides additional soil data collected at the FedEx Ground facility located at 300 Maspeth Avenue, Brooklyn, New York. A site location map is provided as Figure 1. This letter provides a summary of the additional soil investigation that was recommended in our August 28, 2002 correspondence for the delineation of volatile organic compounds (VOCs) north and east of the former underground storage tanks (USTs). A site plan depicting the location of the former USTs and delineation soil borings is provided on Figure 2.

This report also addresses the closure of a 500-gallon UST (believed to have contained waste oil) discovered during the construction work at the site, and an interim remedial measure to remove the heavily impacted soil detected during the delineation investigation.

Delineation Investigation of VOCs under Spill 0202804: UST Area

The additional delineation of VOC impacts detected in the northern and eastern limits of the UST excavation was performed on November 6, 2002. The VOC delineation investigation was conducted using a GeoProbe unit to collect twelve soil samples within a 25-foot grid extending from the former UST excavation (Figure 2). Soil samples were screened vertically in two-foot intervals using a PID. Copies of the soil boring logs are attached. The samples exhibiting the highest PID readings from each boring were submitted for laboratory analysis of VOCs. Analysis of polynuclear aromatic hydrocarbons (PAHs) were also performed by the laboratory to assess Gannett Fleming's opinion that elevated concentrations of PAHs are indicative of background levels resulting from the urban fill used in the region of Brooklyn.

No VOCs were detected in the samples that exceeded the NYSDEC Recommended Soil Cleanup Objectives in the delineation soil borings. Laboratory analytical results are provided in Table 1, and the laboratory reports are also attached.

Continued . . .

The PAH analysis detected dibenzo(a,h)anthracene at 2,200 micrograms per kilogram (ug/kg), indeno(1,2,3-cd)pyrene at 4,800 ug/kg, benzo(a)pyrene at 12,000 ug/kg, benzo(b)fluoranthene at 11,000 ug/kg, benzo(k)fluoranthene at 11,000 ug/kg, chrysene at 14,000 ug/kg, and benzo(a)anthracene at 16,000 ug/kg in sample SB-1 (0-2'), which is above the background concentrations observed at the site. An interim remedial measure was carried out to excavate and remove this affected soil for off-site disposal. The subsequent post excavation soil sample SB-1 (3-4') contained these PAHs at concentrations ranging from 640 ug/kg of dibenzo(a,h)anthracene to 3,300 ug/kg of benzo(a)anthracene. The concentrations of PAHs in the post-excavation sample are consistent with the observed background concentrations for the site. Analytical results for PAHs are provided in Table 1.

Waste Oil UST Closure

On January 8, 2003, a 500-gallon UST was discovered in the vicinity of the former garage. Historical registration information for the site indicates this tank was a waste oil tank that had not been found until that time. One vertical fill pipe from the tank was observed and capped. Brookside Environmental Services opened and cleaned the tank and removed the tank for disposal as scrap steel. The tank contained a few inches of oily water and sludge, which was drummed and disposed of off-site.

No VOCs were detected above the NYSDEC Recommended Soil Cleanup Objectives in end point soil samples TP-1 (Waste Oil Tank 4') and WOT 6', which were collected adjacent to the waste oil UST. The end point samples contained PAHs above the Recommended Soil Cleanup Objectives, but at concentrations consistent with background concentrations observed at the site. The end point soil sample data are provided in Table 1.

Conclusions

Based on the data and the work completed, the following conclusions have been established:

1. VOC concentrations exceeding the NYSDEC Recommended Soil Cleanup Objectives were not found beyond the extent of the former gasoline UST excavation.
2. Concentrations of PAHs were detected above the NYSDEC Recommended Soil Cleanup Objectives. The PAH concentrations found in the soils away from bulk petroleum storage areas further support the opinion that the PAH concentrations are consistent with background levels in the urban fill throughout this region of Brooklyn.
3. One sample location (SB-1) contained carcinogenic PAHs at concentrations not representative of background concentrations found on the site. An interim remedial measure was completed to remove the impacted soil. A supplemental post excavation sample SB-1 (3-4') detected carcinogenic PAHs concentrations consistent with the site background levels, indicating the impacted soils had been removed.

Continued . . .

4. The 500-gallon waste oil UST found in the vicinity of the former garage at the site was removed, cleaned, and the tank and its residual contents disposed of off-site. End point soil samples collected adjacent to the waste oil UST found no impacts present above the site background levels.

Based on the findings of the delineation investigation, the interim remedial measure completed, and the waste oil tank closure, no further action is necessary for the soil on the site.

The construction activities on the FedEx Ground facility are expected to be completed by the end of October 2003. The installation of monitoring wells for the groundwater investigation is anticipated to begin in early November 2003, as proposed in the August 28, 2002 report, and groundwater data should be available in late November 2003.

Please call Gregory Ernst at (516) 671-8440 with any questions regarding this matter.

Yours truly,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

DEC REMARKS:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "SAWYER"
12/11/2002-Vought-Called Ugene Martin and left message to call Demeo or Vought. Also called Dr. Eli N. Avila (917-848-4889) who is owner of property along with Banco Popular and according to Mr. Avila on 4/9/99 there was a large oil spill in basement by Robani Oil and Crystal Oil (subcontractor). According to Dr. Avila: Robani Oil's president (Mr. Robert Pearson-owner) came to site and told Avila that delivery could not be performed due to crack in whistle and that he would have to fix whistle. Mr. Avila told Mr. Pearson to fix whistle. Pearson came to site and replaced fill pipe instead of whistle. As a result basement was filled during delivery event. Robani was called and performed site visit. Free product was removed and sorbent was placed down. Odors still persist till this day. Mr. Avila called hotline in 4/99 and spoke to a Mr. Greene who referred him to DEP. DEP performed site vist and fined Mr. Robani for discharge to sewer. Mr. Avila is currently going to court for damages. Dr. Martin came and performed soil borings and sent soil samples for analysis.

NYSDEC SPILL REPORT FORM

DEC REGION: 2 **SPILL NUMBER:** 0209311

SPILL NAME: MR. AVILA **DEC LEAD:** aaobliga

12/17/2002-Vought-Site visit by Vought. Visual inspection of basement shows oil stains 2" above grade on drywall. Weathered fuel oil odors present in basement. One 1'x 1' excavation with water at depth of 6". No odor or sheen to water. On-site were Dr. Avila and Eugene Martin (consultant). According to Dr. Avila: 1) his lawyer will send him a copy of affadavit regarding admission of liability against Crystal and Robani oil companies 2) Robani/Crystal performed four soil borings in 4/02 3) Eugene Martin (consultant hired by Dr. Avila) performed four soil borings in 5/02. 4) no one is currently living in residence due to odors. NYSDEC requested of Dr. Avila: 1) Boring site plan and analyticals 2) affadavit from judge and all other documents regarding court decisions 3) copy of delivery receipt. NYSDEC inspected neighboring properties at 58 Hamilton Terrace (Troy White 212-694-0445) and Childrens Art Carnival at 62 Hamilton Terrace (Marline Martin 212-234-4093) and found no detectable odors or petroleum impacts.

12/20/02-Vought-Received boring site plan from Martin Geochemistry.

12/23/2002-Vought-Received affadavit, delivery receipt and analyticals from Dr. Avila.

1/8/2003-Vought-Review of documents provided by Dr. Avila. Vought spoke with Randall Austin who directed Vought to 1) investigate the call made to Mr. Greene at spills hotline on 4/9/99 and 2) foward file to David Rubinton (NYSDEC legal for review). Vought called Avila and left him message of directive.

1/8/2003-Vought-Vought instructed by Rubinton to contact RP to give them opportunity to clean spill. Vought called Robani Oil 212-687-8699 and left message for Mr. Pearson to call NYSDEC. Vought called Crystal Transportation 718-828-3100 and spoke with Mr. Frank Rizzo who said that message would be passed on to company owners. Mr. Rizzo could not say whether NYSDEC would receive a call back from Crystal and that further inquiries should be fowarded to Robani.

1/8/2003-Vought-Spoke with Robert Pearson who will turn call over to Chris Foley (attorney). Mr. Pearson stated that Robani will not institute remedial acivities due to possiblity of previous spills at Site. Vought also spoke with Rubinton who said to fill out case initiation form and send it to Region 2 legal.

1/9/2003-Vought-Gave case intiation form to David Rubinton (Region 2-legal). Vought spoke with supervisor Rommel who instructed to send do work letters to both oil companies and respective lawyers. Vought called Dr. Avila and informed him of case intiation and sending of do work order to Crystal, Robani and respective lawyers. Do work letters sent by Vought on 1/9/2003.

1/10/2003-Vought-Received letter fom Foley stating "they were interested in discussing and potentially resolving" issues of 1/9/2003 do work letter.

1/13/2003-Vought-Received fax from Chirstopher Foley (representing Robani Energy) who stated that after he spoke with representation of Crystal Transportation a contractor would be called to perform remediation. Vought recevied call from Brian Campbell (Vertex Engineering 781-952-6047) stating that he was called by Foley and was requesting list of contractors. Campbell will supervise contractors. Vought faxed list on 1/13/2003 and also suggested to Campbell that he contact Eugene Martin. Campbell will call back NYSDEC with contractor decision. Vought also gave Campbell names and contacts at NY State Dept of Health to certify reoccupation.

1/13/2003-Vought-Received message from Matt Spears (Kressner 718-584-8484) representing Dr. Avila requesting FOIL information. Vought called and left Spears message. Vought also received message from Eric Slessinger (Caroll & Mcnulty-212-868-9090x405) reresenting Crystal Transportation. Vought called Slessinger and left message to call NYSDEC.

1/14/2003-Vought-Received message from Spears requesting foil information. Vought called Spears and suggested postponing FOIL request until decision arrives from Foley and Robani Energy. Vought told Spears to call 1/21 for updates (after due date on Do Work letter) sent 1/9/2003.

1/15/2003-Vought-Received message from Eric Slessinger. Vought called Slessinger who received letter and said that he will call Rubinton to discuss legal issues. Slessinger stated that it would be difficult to obtain contactor by due date on Due Work letter because they were looking to seek action against other oil companies which delivered to Site before spill event. Vought will contact Rubinton before PIN job is opened.

1/17/2003-Vought-Received message from Foley. Vought called Foley and left message. Foley returned call who was in court on 1/16. According to Judge Marcy Friedman Robani/Crystal will have time before trial to clean spill. Trial is scheduled for 3/24/2003. Foley has called Miller and Milro and scheduled a possible site visit for Wed 2/22/2003. Vought called Avila and notified him of possible site visit date. Vought will call Kressner to facilitate site visit.

1/21/2003-Vought-Spoke to Foley and contractors will be Milro and Brookside. Will attempt to arrange site for tommorrow (212-363-1300) despite lack of response from Kressner or Avila. Vought called Kressner to facilitate visit and left message to return call to NYSDEC. Vought spoke with Kressner and site visit is arranged for tomorrow. Kressner left message for Foley approving of site visit.

2/4/2003-Vought- Spoke with Dr. Martin performed test bore under 58 Hamilton on 1/29/03 and found PID reading of 5ppm. Sample will be sent for analysis and will fax me analyticals. Vought called Foley (212-363-1300) for update on contractors and left message to call Vought back. Vought called Kressner and he is skeptical of results and does not believe in state supervision. Vought called Dr. Avila. According to Dr. Avila three consulting companies performed a site visit and no proposals were submitted. Vought will attempt to arrange meeting between Kressner, Foley, RObani, Avila, DOH, Landmarks, Martin to prevent PIN project from being opened. Vought arranged meeting for 2/27/2003.

2/5/2003-Vought-Received letter from Foley asking if DEC was instructing them to refrain from proceeding with

remediation until 2/27/2003 meeting.

2/7/2003-Vought-Letter sent by NYSDEC (Rubinton) to Kressner stating that failure of Avila to take actions to address petroleum discharges would subject Avila to liabilities as a responsible party.

2/11/2003-Vought-NYSDEC sent letter to Foley that pre-hearing conference for 2/19 is adjourned due to scheduled 2/27 meeting.

2/20/2003-Vought-Work proposals submitted by Brookside Environmental (environmental consultant) and H2M (structural engineer).

2/26/2003-Vought-Send work proposal review letter to Brookside and all involved parties requiring STARS 8260/8270 analyes, collection of endpoint samples, description of sampling methods, scaled Site plan and concrete encapsulation.

2/27/2003-Vought-Meeting at NYSDEC with Kressner,Foley , Stapleton, Landmarks, NYC Dept. of Heath, Martin, Robani. Meeting. All parties agreed that a structual engineer report will be produced by Vertex engineering (Scott Hamarich 631-758-1580). Vertex will be supervising Brookside. Engineer report will be sent to Landmarks and then to Dept. of Buildings for approval who will review report by 3/21. Copies of report will also be sent to DEC and Kressner. Brookside will also produce addendum to scope of work incorporating NYSDEC 2/26 proposal review letter comments.

3/7/2003-Vought-Received proposal from H2M (Michael McKeown-631-756-8000) who is structural engineer hired by Robani. Proposal approves basement excavation and aslo said that boring was performed by H2M and bedrock is at 2.5'. Vought sent letter to Dr. Martin requesting all previous boring logs, sample analyticals and sample depths.

3/18/2003-Vought-Spoke with Brian Stapleton submitted report to Kressner on 3/10. Stapleton has not yet received response from Kressner. Vought told Stapleton that Landmarks and DOB approval of structural report and final draft workplan to NYSDEC were needed as stated in meeting.

4/30/2003-Vought-Spoke with Dr. Avila who inquired about next step for remedial action despite private lawsuit between Avila and Oil companies. Vought told Avila to call Rubinton because Rubinton told Vought not to take any action until Rubinton gave approval.

12/10/03 - AUSTIN - PROJECT TRANSFERRED FROM VOUGHT TO SAWYER - END

NYSDEC SPILL REPORT FORM

DEC REGION: 2 **SPILL NUMBER:** 0209311

SPILL NAME: MR. AVILA **DEC LEAD:** aaobliga

12/2/04 - Sawyer - Received work proposal on 10/21 from Vinny at Island Environmental Tank.

1/6/05 - Sawyer - Talked to Melanie at Island Environmental Tank and answered her questions about offsite contamination. The subsurface investigation and delineation will encompass all areas associated with the spill.

5/31/05 - reassigned to Vought by Koon Tang since DEE needs technical support for enforcement action, and Chris Sawyer has just left the Department. - KST

9/12/05 - Obligado - Site transferred from Vought to Obligado.

Re: Well Abandonment
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Obligado:

As indicated in your December 22, 2005 letter, Gannett Fleming has conducted adequate investigation at the above referenced site and therefore Spill Numbers 0202804 and 0204002 have been closed. In response, the seven on-site monitoring wells have been properly abandoned.

On February 15, 2006, Gannett Fleming contracted Associated Environmental Services, Ltd. to abandon wells MW-1 through MW-7. The riser pipe and PVC screen were removed from each monitoring well and the open boreholes were backfilled with clean sand to a depth of two feet above the water table (based on water level measurements from the investigation). One foot of bentonite chips was subsequently poured on top of the sand fill and hydrated. The remainder of the each open borehole was filled with a cement/bentonite grout mixed at a ratio of one 50-pound bag of Portland cement to one 50-pound bag of bentonite to 10 gallons of water. The grout in each well was allowed to settle and then refilled to grade with the flush-mount manhole boxes left in place. The lids of the manhole boxes were removed in order to smooth the grout to grade.

Please do not hesitate to contact us with any questions.

Very truly yours,

GANNETT FLEMING ENGINEERS, P.C.

ANTHONY T. VANATTA
Environmental Scientist

STEPHEN R. HIX
Director of Environmental Services

NYSDEC SPILL REPORT FORM

DEC REGION#: 2 **SPILL NUMBER:** 0202804

SPILL NAME: **DEC LEAD:** JBVOUGHT

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "VOUGHT"

10/15/04-Vought-File review by Vought:

Access Agreement-7/10/02. Access agreement for FedEx to remove USTs and portion of tankfield on adjacent property.

Letter from Testwell Labs(Pearce) to FedEx(Swart)-7/10/02. Work proposal for installation of nine soil borings, field screening of soil samples, conversion of three of the borings into monitoring wells, quarterly sampling of the wells and further excavation of the soil and piping.

Letter from Testwell Labs(Pearce) to DEC Vought-7/22/02. Soil "samples were taken from the walls and groundwater after the underground fuel storage tanks and surrounding had been removed..." Testwell recommends: 1)backfilling of UST excavation 2)SVOC's are due to fill material 3)if wells are deemed necessary "they are to be installed at a later date after site work (piles and foundations) is complete" 4)remaining vent lines terminate at surface level and remaining contaminated soil on adjacent property should be removed.
Letter from Gannett Fleming (Ernst) to DEC Vought-8/13/02. "This letter is intended to inform the NYSDEC of the projected site remediation activities." "Based on the endpoint soil data (samples WSW and SSW no further action is recommended for the soil beneath facility footprint which is currently under construcion". No groundwater monitoring wells are proposed inside the facility." Gannett Fleming will provide a comprehensive site investigation report on both the UST removal and for the "black tar like substance found in the southwestern portion of the site".

Report from Gannett Fleming to DEC Vought-8/28/04. "This letter provides a summary of the additional investigation activities and sample analysis that have taken place....." Removal of twenty (550-gallon) gasoline USTs and 900 tons of impacted soil. See above 7/22/02 entry for endpoint analyticals. Soil analyticals show 7750ppb 1,3,5-trimethylbenzene(WSW Wall) and 6470ppb xylene(WSW Wall), 110ppb benzene(vent x bottom), 110ppb benzene(Vent x sw), 120ppb benzene(n wall composite), 5900ppb 1,3,5-trimethylbenzene(n wall composite), 11000ppb 1,2,4-trimethylbenzene(n wall composite). Groundwater analytical from one well shows 40ppb benzene and 26ppb xylene. "Black stained soil exhibiting a strong petroleum odor was observed adjacent to the southwestern portion of the existing warehouse". Seven test pits were dug to delineate the stained soil but no groundwater samples were collected. Report recommends: 1)no further actions for soils south and west of the former UST area 2)additional delineation north and east of the former UST area via Geoprobe 3)installation of six montoring wells (two upgradient and four downgradient). Investigation activities will be provided to DEC in a supplemental site investigation report. Soil analyticals shos PAH exceedences throughout site due to fill material.

Report from Gannett Fleming to DEC Vought-6/8/04. "This letter report documents the results of investigative activities conducted...." "A review of historic Sanborn maps indicate a Brooklyn Union Gas bulk petroleum storage and distribution terminal was present in the southwestern portion of the site in 1951. Installation of six monitoring wells. An additional well was installed to replace a well destroyed in the tankfield excavation. Groundwater at a depth of 8' below grade. "..groundwater flows to the north in the northern portion of the site. Groundwater flows converge to the east in the southern portion of the site". Groundwater analyticals show 21ppb ethylbenzene(MW1), 13ppb 1,3,5-trimethylbenzene(MW1), 97ppb napthalene(MW1), 10ppb benzene(MW2), 7ppb ethylbenzene(MW2), 93ppb napthalene(MW2), 20ppb benzene(MW7), 7ppb ethylbenzene(MW7), 35ppb xylene(MW7), 52ppb napthalene(MW7). Soil analyticals showed no VOC exceedences and SVOC exceedences attributable to fill material. Report recommends: 1)no further action with respect to soil 2)no further action for onsite groundwater due to "poor regional groundwater quality". Report requests no further action. DEC requires: 1)one full year of groundwater monitoring prior to closure.

SITE ACCESS AGREEMENT

THIS AGREEMENT is made and entered into this 10th day of July, 2002 by and between **JC-DUGGAN, INC., BRIA REALTY CORPORATION**, its successors and assigns (collectively "Grantor"), with offices at 320 Maspeth Avenue, Brooklyn, New York (the "Property") and **FEDEX GROUND PACKAGE SYSTEM, INC.** ("FedEx"), with offices at 1000 FedEx Drive, Moon Township, Pennsylvania (Grantor and FedEx are hereinafter collectively referred to as the "Parties"),

WHEREAS FedEx requires access to the Property for the limited purpose of removing two (2) suspect underground fuel tanks and piping associated with FedEx's fuel system and installing, maintaining and sampling, at its sole cost, expense and risk, soil borings, test pits and temporary monitoring wells associated with investigative/remedial activities related to contamination emanating from the Neighboring Premises located at 300 Maspeth Avenue, Brooklyn, New York owned by FedEx (the "Work").

WHEREAS contamination having been identified on the 300 Maspeth Avenue, Brooklyn, NY premises (the "Neighboring Premises"), the Work is required to be supervised by the New York Department of Environmental Conservation ("NYDEC") to evaluate the nature and extent of said contamination.

WHEREAS FedEx has retained various contractors ("Agents") to perform the Work on FedEx's behalf; and

WHEREAS Grantor agrees to provide FedEx and its Agents, with access to the Property to perform the Work;

NOW THEREFORE, in consideration of the promises, mutual covenants and agreements contained herein, the Parties agree as follows;

1. Grantor hereby grants FedEx and its Agents, permission to enter upon the Property for the limited purpose of performing the Work. The Work shall be performed in accordance with all applicable statutes, ordinances, rules, regulations, orders and requirements of all Governmental Authorities.

2. FedEx and its Agents, shall:

a) perform the Work in a workmanlike manner and in accordance with industry standards and shall exercise all measures to conduct the Work so as to minimize the disturbance of existing conditions at the

Property;

b) minimize any business disruption by exercising all measures to limit the area of activity to the area in and around the suspected contamination; however, Grantor expressly agrees that FedEx and its Agents, are permitted to perform the Work during normal business hours (during weekdays only between 8:00 am-3:00 pm);

c) obtain all required utility mark-outs prior to conducting the Work and to take all measures necessary to prevent any disturbance or damage whatsoever to such utilities;

d) provide any necessary restoration work pursuant to Paragraph 7 of this Agreement;

e) at Grantor's request, provide Grantor with split samples of any samples taken in connection with the performance of the Work; and

f) upon completion of the Work, FedEx and its Agents, shall provide Grantor with a map showing the precise location of the sampling points and copies of reports of the analytical results of the sampling work.

3. Prior to commencing the Work at the Property, FedEx and its Agents, shall notify Grantor at least 24 hours prior to entry onto the Property, provide written notice describing the specific location, physical work, sampling to be conducted, and parameters for lab analysis, for which access is sought and must obtain Grantor's approval.

4. Any notice required under this Agreement shall be made by facsimile or overnight courier to both parties at the addresses listed below, or to any other addresses subsequently provided by the Parties. Notice shall be complete upon its receipt by the addressees listed below'

To Grantor: Michael G. Stingone, Esq.
Cole Schotz Meisel Forman and Leonard, P.A.
25 Main Street
Hackensack, NJ 07602
Facsimile No. (201) 678-6313

Jerry Swart
FedEx Ground Package System, Inc.
1000 FedEx Drive
Moon Township, PA 15108
Facsimile No. (412) 859-5450

5. All equipment necessary to perform the Work and any needed restoration work must be removed from the Property on a daily basis at the conclusion of work for that day. If necessary to complete the Work, FedEx shall be responsible for moving the 20-foot ocean freight container located on the Property, utilized for storage purposes, to a temporary location approved by Grantor. Upon completion of the Work, FedEx will replace said container in its original location.

6. Following completion of the Work, FedEx or its Agents, shall restore the Work area to substantially the same condition existing prior to commencement of their entry onto the Property, including the removal of all equipment used in the performance of the Work. Restoration shall include:

a) replacement of the excavated soils with compacted, certified clean fill material;

b) replacement of any removed or damaged landscaping; and

c) replacement of any pavement, including, as necessary, parking lines, signs, or any other parking accouterments.

7. FedEx and its Agents, shall provide Grantor with copies of any correspondence with the NYDEC regarding the Work within 5 business days of the date

of such correspondence.

8. This Agreement obligates FedEx to be responsible for the investigative and remedial costs associated with the contamination emanating from the Neighboring Premises, which may be migrating onto the Property.

9. FedEx hereby releases and discharges and shall defend, indemnify and hold Grantor harmless from any and all damages, demands, losses, claims, liabilities and penalties, including attorney's fees and costs, whether brought against Grantor by third-parties who do not have a contractual relationship with Grantor, including governmental entities, or by third parties with whom Grantor has contracted, in each case, caused by the performance of the Work or other activity by FedEx or its Agents in the vicinity of the Property in connection with the performance of the Work, including liability for the remediation of any environmental contamination which is emanating or which emanated from the Neighboring Premises or caused by FedEx, but excluding liability for any pre-existing contamination found on the Property not caused by FedEx. Grantor shall notify FedEx in writing of any indemnity claim arising under this paragraph 9 and give FedEx the opportunity to defend.

10. Each Agent(s) shall maintain Comprehensive General Liability ("CGL"), with a minimum limit of $5,000,000, and Workmen's Compensation policies. Said policies are incorporated herein by reference. All premiums or other costs associated with the required insurance shall be borne solely by Agent(s). Grantor will be named on the Certificate of Insurance for Agent(s)'s CGL policy as an additional insured and shall provide the certificates to Grantor's counsel prior to commencing the Work.

11. This Agreement is not intended to, and does not, create any form of agency relationship between Grantor and FedEx and its Agents.

12. This Agreement is solely for the benefit of the Parties, and it shall not be transferable, assignable, or otherwise alienable, to any other party without prior written consent of the Parties.

13. The right to access conferred by this Agreement is terminable by Grantor immediately upon notice to FedEx and shall not be construed as any form of interest in the Property, including, but not limited to, an ownership, tenancy and/or operational interest.

14. This Agreement is the complete and exclusive statement of the terms and conditions hereof, notwithstanding any representations or statements to the contrary

heretofore made. Any modifications to this Agreement shall be in writing, executed by both Parties and shall specifically state that it is such a modification.

15. The parties to this Agreement represent that they have read and understand its terms. Each party, if so desired, has been advised by counsel as to its meaning and legal implications and freely executes this Agreement.

16. Each person executing this Agreement represents that the party on whose behalf the person is executing this Agreement has duly authorized the execution of this Agreement and that such person is authorized to execute the Agreement on behalf of such party.

17. This Agreement may be executed in several counterparts, each of which may be deemed an original, and all of such counterparts together shall constitute one and the same Agreement.

18. This Agreement may be executed by facsimile transmission and shall be deemed to have been executed and delivered by each party on the date so transmitted to the other party, and in such event, each party will promptly furnish to the other party, an original counterpart hereof executed by such party.

IN WITNESS HEREOP, the Parties hereto have executed, or caused to be executed, this Agreement as of the date and year first written below.

Soil Boring Work Plan

Dear Mr. Swart:

ISO 9001 CERTIFIED

On or about July 11, 2002 Testwell Laboratories, Inc. (TLI) will conduct a soil boring operation to delineate the extent of petroleum contamination regarding the above referenced site. Prior to the start of work the area must be free from equipment and debris, also all utilities will be marked out through the "One Call" Service.

The work activities are as follows:

NVLAP
NVLAP LAB CODE 200083-0

1. Initially TLI proposes to perform a total of nine soil borings around the tank pit area, three of which will be converted into ground water monitoring wells.
2. Field soil screening will be performed for each boring and additional borings may be required to delineate the extent of contamination extending out radially and staggered from the initial borings.
3. Three of the borings will be converted into monitoring wells (one well will be on the adjacent property - Duggan). These wells will be capped and two will extend above ground level and one will be flush mounted with the asphalt (adjacent property).
4. The wells will be sampled on a quarterly basis for a minimum period of one year therefore access must be provided for that time.
5. After the pit has been filled in (to minimize undermining) the vent pipes and soil around them will be removed in an effort to dispose of the gross contamination.

RE: FedEx Ground
300 Maspeth Avenue
Soil Boring Work Plan

July 10, 2002
Page 2 of 2

TLI will obtain soil and water samples from the borings/monitoring wells and have them analyzed using EPA Method 8021 & 8270 (STARS) in addition to Lead and MTBE to determine quantity and characterization of the contamination. After the sample results have been reviewed a recommendation will be made whether to install a remediation system or continue excavation to clean soil.

If you have any questions regarding this matter please do not hesitate to call us at (914) 944-2592.

Sincerely,

Dean Pearce

Subject: FedEx Ground Maspeth Ave.

Jeff; confirming our discussion, we found an oily substance on the groundwater during excavation activities along the west side of the facility this week. Per your instruction I notified the hotline-spill #0204002. The photos and site maps showing approximately locations are attached.

We will likely backfill the excavations where we encounter this material so we don't delay construction with the understanding we will address this unknown substance as construction advances.

There does not seem to be any consistent encounter with this material. Less than 15 feet away they did not observe this, so we are not sure if it is isolated, however Gilbane believes they also observed this oil on the east side as well so we do not know the extent of this yet.

You are welcome to visit the site today at 1PM when Gannett Fleming and Testwell will be meeting to discuss the situation.

If you discover any information on any potential off-site sources for this oil please let us know.

Thanks.

Jeff; confirming our discussion, we found an oily substance on the groundwater during excavation activities along the west side of the facility this week. Per your instruction I notified the hotline-spill #0204002. The photos and site maps showing approximately locations are attached.

We will likely backfill the excavations where we encounter this material so we don't delay construction with the understanding we will address this unknown substance as construction advances.

There does not seem to be any consistent encounter with this material. Less than 15 feet away they did not observe this, so we are not sure if it is isolated, however Gilbane believes they also observed this oil on the east side as well so we do not know the extent of this yet.

You are welcome to visit the site today at 1PM when Gannett Fleming and Testwell will be meeting to discuss the situation.

If you discover any information on any potential off-site sources for this oil please let us know.

Thanks.

Regarding: FedEx Ground Facility
300 Maspeth Ave, Brooklyn, NY
Soil Sampling Results

Dear Mr. Vought:

We have reviewed the results for the soil samples taken on July 3, 2002 regarding the above referenced site. These samples were taken from the walls and groundwater after the underground fuel storage tanks and surrounding soil had been removed resulting in a 56 FT. Wide X 42 FT. Long X 10 FT. Deep excavation. We recommend the following:

1. The Underground Storage Tank area is relatively clean according to the results and request that the area be backfilled as no further excavation is warranted.
2. Any high Semi-Volatile Organic Compound readings are probably due to the site condition of 7 FT. – 8 FT. layer of fill material over a layer of peat.
3. If wells are deemed necessary due to the high Benzene level in the groundwater sample, they are to be installed at a later date after site work (piles and foundations) is complete.
4. The remaining vent lines that terminate at the surface level and associated contaminated soil on the adjoining property should be removed.

We believe that the Photoionization Detector's (PID) readings were high when excavation was halted due to the decomposition of the peat layer and methane gas permeating up through the fill layer. The excavation of the soil around the removed tanks has evidently removed the fuel oil contaminant.

TESTWELL LABORATORIES, INC.

Mr. Jeffrey Vought, Engineering Geologist

Re: FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804

Dear Mr. Vought:

Gannett Fleming Engineers and Architects, P.C. has been retained by FedEx Ground to provide environmental consulting services at the 300 Maspeth Avenue facility in Brooklyn. This letter is intended to inform the New York State Department of Environmental Conservation (NYSDEC) of the projected site remediation activities surrounding the underground storage tanks (USTs) related to the construction at the site.

As we discussed on Wednesday, August 7th, data collected by Testwell Laboratories, Inc. indicated the UST excavation end points were substantially in compliance with NYSDEC Recommended Soil Cleanup Objectives with the exception of the soil sample collected along the northern wall of the excavation (Samples ENE, NNE, and NNW). Residual petroleum was also detected in groundwater observed in the excavation.

This characterization is important to the construction schedule, since the footprint of the facility expansion work will cover a portion of the UST excavation. The approximate location of the facility expansion footprint relative to the UST excavation is provided on the attached Location Plan.

Based on the end point soil data (Samples WSW and SSW), no further action is recommended for the soil beneath facility footprint, which is currently under construction. Additionally, no groundwater monitoring wells are proposed inside of the facility. Any future groundwater monitoring wells will be installed within parking areas and/or the 35-foot wide alleyway that will remain around the exterior of the facility. The completion of the facility expansion will not obstruct further investigation of petroleum impacts along the northern wall of the UST excavation.

Gannett Fleming Engineers and Architects, P.C.

Jeff Vought
New York State Department of
Environmental Conservation
August 13, 2002

Gannett Fleming will provide a comprehensive site investigation report on both the UST removal (Spill #0202804) and for the black tar-like substance found in the southwestern portion of the site (Spill #0204002) as additional data for these locations becomes available. This data is not expected to affect our recommendations.
Please indicate the NYSDEC's response to these recommendations. Your timely response will be greatly appreciated, since the construction in the former UST excavation area is proceeding rapidly.

Please call with any questions.

Very truly yours,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

GREGORY ERNST
Senior Scientist

STEPHEN R. HIX

Re: Site Investigation
FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Vought:

This letter report documents the results of investigative activities conducted at the above referenced site. A site location map is provided as Figure 1, attached. This investigation was conducted to further assess impacts associated with two recent New York State Department of Environmental Conservation (NYSDEC) spill numbers assigned to the site. NYSDEC Spill #0202804 addresses petroleum-impacted soils discovered during the removal of 20 underground storage tanks located in the northeastern portion of the site in June and July 2002. NYSDEC Spill #0204002 was assigned to black-stained soil exhibiting strong petroleum odors discovered in the southwestern portion of the site during construction activities. A review of historic Sandborn Maps indicate a Brooklyn Union Gas bulk petroleum storage and distribution terminal was present in the southwestern portion of the site in 1951. The investigation of impacted soil associated with both spill numbers was previously discussed in our August 28, 2002 letter report.

The scope of this investigation was developed based upon the conclusions and recommendations provided by Gannett Fleming (GF) in our August 28, 2002 letter report. The purpose of this investigation was to confirm that polynuclear aromatic hydrocarbon (PAH) concentrations detected in soil are ubiquitous to the urban fill at the site and to determine if on-site and off-site petroleum releases have impacted groundwater quality at the site. Soil samples were collected from six soil borings advanced at the site. Soil samples were collected to assess PAH concentrations in soil throughout the site relative to the areas of the former underground storage tank (UST) excavation (Spill #0202804) and in the southwest portion of the site (Spill #0204002) where the former Brooklyn Union Gas terminal was present. Monitoring wells were installed in each of the boreholes to assess on-site groundwater quality. A Site Plan is provided as Figure 2.

Continued . . .

Background

In June and July 2002, Brookside Environmental Services (Brookside) removed 20 USTs and approximately 900 tons of petroleum-impacted soil from the site. Spill #0202804 was issued to the site due to the petroleum impact to the site subsurface caused by the USTs.

Soil Boring Advancement and Soil Sampling

On December 8 and 9, 2003, Associated Environmental Services, Inc. (Associated), under contract to GF, advanced six soil borings (B-1 through B-6) using a hollow stem drill rig (B-1, B-5, B-6) or a Geoprobe® rig (B-2, B-3, B-4). The soil borings were drilled at the monitoring well locations MW-1 through MW-6 in advance of installing the wells (see below). A site plan depicting the soil boring locations is provided as Figure 2, attached. Soil samples were collected continuously down to the water table using a 2-foot long split spoon (SS) sampler (B-1, B-5, B-6) or a 4-foot long Macro-Core® sampler with dedicated acetate liners (B-2, B-3, B-4). All non-dedicated sampling equipment, i.e. SS sampler, was field decontaminated using a non-phosphate detergent wash followed by a potable water rinse prior to and between each sample collection. A new acetate liner was used for each sample collected using the GeoProbe® rig. Each sample was lithologically logged and field screened for organic vapors using a photoionization detector (PID) by a GF environmental professional. The soil boring logs are provided in Attachment A.

One soil sample was retained from each boring from the depth interval exhibiting the greatest evidence (odor, staining, or PID reading) of contamination. For borings exhibiting no evidence of contamination, a soil sample was retained from immediately above the water table. Retained samples were placed in an ice-filled cooler and delivered to EcoTest Laboratories, Inc. (NELAP #10320) for analysis for VOCs by Method 8021 and PAHs via Method 8270 using New York Department of Environmental Conservation (NYSDEC) Spill Technology and Remediation Series (STARS) Memorandum #1 criteria. Chain-of-Custody protocols were followed for the handling and delivery of the soil samples.

Monitoring Well Installation and Groundwater Sampling

Monitoring wells (MW-1 through MW-6) were installed in each of the boreholes (B-1 through B-6). An additional monitoring well (MW-7) was installed in the area of the former UST excavation to replace a former well point (WP-1) destroyed during site development activities.

Continued . . .

A borehole was drilled at each well location to a depth of approximately 20 feet below grade with a drill rig using 6-inch diameter hollow stem augers, with the exception of MW-3. At MW-3, the borehole was drilled using a 4-½ inch hollow stem auger because MW-3 was installed in a pre-existing 1-foot diameter manway located within the newly constructed, reinforced concrete truck apron. Groundwater was encountered at a depth of approximately 8 feet through out the site. Monitoring wells consisting of 4-inch diameter PVC with a 15-foot screened interval were installed at each location, with the exception of MW-3 (which was completed as a 2-inch diameter monitoring well). Once the well riser was in place, each borehole was backfilled with #2 sand up to a depth of 2 feet below grade. A bentonite seal was installed above the sandpack. Wells were finished with a concrete slab and an at-grade flush-mount curb-box cover. Locking well caps were placed on all monitoring wells. GF personnel developed each of the wells using a centrifugal pump. Each well was developed by purging a minimum of 5 well volumes or until dry. Well construction logs are provided in Attachment B.

GF personnel returned to the site on January 6, 2004 to sample the on-site monitoring wells. Prior to sampling, depth to water measurements were collected from each well. Each monitoring well was purged of groundwater a minimum of three volumes or until dry using a centrifugal pump with dedicated polyethylene tubing. The wells that dried were allowed to recover prior to sample collection. Groundwater samples were collected from each monitoring well using dedicated polyethylene bailers. Samples were placed in an ice-filled cooler and delivered to EcoTest for analysis for VOCs by EPA Method 8021 and PAHs by EPA Method 8270 using NYSTARS criteria. Chain-of-Custody protocols were followed for the handling and delivery of the groundwater samples. Glassware containing a portion of the groundwater sample from MW-5 was destroyed during transport. GF personnel returned to the site on January 9, 2004 to resample the well.

The drill cuttings from monitoring installation were placed in eight 55-gallon drums for transport and disposal. On March 3, 2004, the eight drums of drill cuttings were transported from the site for disposal at Waste Recovery Solutions, Inc. in Myerstown, Pennsylvania as non-hazardous waste.

Results

Based upon groundwater elevation measurements, groundwater flows to the north in the northern portion of the site. Groundwater flows converge to the east in the southern portion of the site. A site plan depicting groundwater elevation contours is provided as Figure 2.

Continued . . .

No VOCs were detected above Recommended Soil Cleanup Objectives (RSCOs) in any of the six soil samples. The following PAH compounds were detected over RSCOs:

	NYSDEC Recommended Soil Cleanup Objectives (RSCOs)	B-1 (9'-10')	B-2 (7'-7.5')	B-3 (9'-10')	B-4 (8'-9')	B-5 (8'-9')	B-6 (9'-10')
Benzo(a)anthracene	224 or MDL	620	2,100	4,800	4,000	3,300	1,000
Benzo(b)fluoranthene	220 or MDL	500	1,900	4,100	3,900	2,700	850
Benzo(k)fluoranthene	220 or MDL	500	1,900	4,100	3,900	2,700	850
Benzo(a)pyrene	61 or MDL	560	1,900	4,200	4,000	2,700	760
Chrysene	400	560	2,000	5,200	3,700	3,300	990
Dibenzo(a,h)anthracene	143 or MDL	--	--	800	360	450	--

All concentrations are measured in micrograms per kilogram (µg/kg).

No VOCs or PAHs were detected above NYSDEC Groundwater Standards in MW-3, MW-4, MW-5, or MW-6. The following VOC and PAH compounds were detected above NYSDEC Groundwater Standards in MW-1, MW-2, and MW-7:

	NYSDEC Groundwater Standards	MW-1	MW-2	MW-7
Benzene	0.7	--	10	20
Ethylbenzene	5	21	7	7
Total Xylenes	5	--	--	35
1,2,4-Trimethylbenzene	5	--	--	12
1,3,5-Trimethylbenzene	5	13	--	--
Naphthalene (VOC)	10	--	93	52
Benzo(a)anthracene	0.002	--	1	--
Chrysene	0.002	--	1	--
Naphthalene (PAH)	10	97	43	28

All concentrations are measured in micrograms per liter (µg/l).

Laboratory data sheets are provided as Attachment C.

Conclusions

- The soils observed beneath the site consist of between approximately five to eight feet of "urban fill" (soil mixed with concrete, brick, and C&D material) over tight, organic clay. Based on the history of the site, the organic clay is remnant of the salt marsh present in this area prior to development.
- No VOCs were detected above NYSDEC RSCOs in any soil samples collected from the six borings.

Continued . . .

- Several PAH compounds were detected above NYSDEC RSCOs in soil samples collected from the six borings.
- No VOC or PAH compounds were detected above NYSDEC groundwater standards in MW-3, MW-4, MW-5, or MW-6.
- Several VOC compounds were detected above NYSDEC Groundwater Standards in MW-1, MW-2, and MW-7. Additionally, two PAH compounds were detected above groundwater standards in MW-2.

The occurrence of PAHs in the soils at the FedEx Ground facility appear to be ubiquitous within the urban fill material observed in the borings and presumably placed on the site when first developed in the 1950's. Concentrations of PAHs in soil samples were consistent throughout the site. Soil samples collected from areas away from the former tank locations (i.e. the USTs and the Brooklyn Union Gas terminal) also detected PAHs. The distribution of PAHs and consistency in their concentrations is indicative of the general fill quality found at the site.

The occurrence of VOCs in the groundwater samples collected from MW-1, MW-2, and MW-7 are likely indicative of regional groundwater quality. The site is located in a predominantly industrial area of Brooklyn, New York and there are significant known impacts to regional groundwater quality.

Recommendations

The following recommendations are provided regarding the soils and groundwater at the FedEx Ground facility.

- No further actions are recommended for on-site soils. VOCs were not detected above the NYSDEC RSCOs, and concentrations of PAHs appear characteristic of the urban filled placed at the site during its first development in the 1950's.
- No further actions are recommended for on-site groundwater. VOC concentrations detected above NYSDEC Groundwater Standards in MW-1, MW-2, and MW-7 appear characteristic of regional groundwater quality. There are significant known impacts to regional groundwater quality and groundwater is not used for potable use in the vicinity of the site. No exposure pathways exist at the site so that the relatively low VOC concentrations on the site do not pose a threat the human health or the environment. The removal of the USTs and adjacent VOC contaminated soil from the site effectively ends any contribution to the poor regional groundwater quality. GF recommends that Spill Numbers #0202804 and #0204002 be closed for the site and no further action be required by NYSDEC.

MONITORING WELL CONSTRUCTION INFORMATION

JOB No. : 39936.003 CLIENT : FedEx Ground

LOCATION : 300 Maspeth Avenue

DATE : 12/15/03 WELL No.: MW-4

HYDROGEOLOGIST : ANTHONY VANATTA

DRILLING CONTRACTOR : Associated Environmental

1). SCREEN TYPE : PVC

SLOTTED LENGTH : 15'

SLOT SIZE : 25

2). SOLID PIPE TYPE : PVC

SOLID PIPE LENGTH : 5'

PIPE & SCREEN DIA. : 4"

JOINT TYPE-SLIP / GLUED : ____ THREADED √

3). TYPE OF BACKFILL AROUND SCREEN :

2 SAND

4). TYPE OF SEAL (IF INSTALLED) :

BENTONITE

5). TYPE OF BACKFILL: #2 Sand

HOW INSTALLED: POURED IN

6). TYPE OF SURFACE SEAL (IF INSTALLED):

MANHOLE

7). PROTECTIVE CASING: YES √ NO ____

LOCKING CAP: YES √ NO ____

8). CONCRETE SEAL: YES √ NO ____

9). DRILLING METHOD:

HOLLOW STEM AUGER

10). ADDITIVES USED (IF ANY):

WATER LEVELCHECKS*

DATE	TIME	DEPTH TO WATER	REMARKS

Re: FedEx Ground
300 Maspeth Avenue
Brooklyn, New York 11211
NYSDEC Spill #0202804 and #0204002

Dear Mr. Vought:

This letter supplements our August 13, 2002 correspondence discussing the initial site assessment and projected remediation activities for petroleum impacts observed (New York State Department of Environmental Conservation (NYSDEC) Spill #0202804 and #0204002 at the FedEx Ground facility located at 300 Maspeth Avenue, Brooklyn, New York. A site location map is provided as Figure 1, attached. This letter provides a summary of the additional investigation activities and sample analysis that have taken place since the initial sampling and assessment by Testwell in July 2002.

Spill 0202804: UST Area

From June 17 to July 3, 2002, Brookside Environmental Services (Brookside) removed 20 USTs and approximately 900 tons of petroleum-impacted soil surrounding the USTs under the direction of Testwell. From July 26 to July 30, 2002, the UST excavation was backfilled by Brookside using structural fill (DOT Item 4). Gannett Fleming observed backfilling the excavation. Prior to backfilling, additional soil was removed from the northern wall and from the southwest corner of the excavation to assess the extent of volatile organic compounds (VOCs) and polynuclear aromatic hydrocarbons (PAHs) detected in the end point samples collected by Testwell (see Table 1). The remaining vent lines were excavated and removed from the neighboring property on July 30, 2002 by Brookside under the direction of Gannett Fleming. Figure 2 provides a site plan of the former UST excavation area. Photos of the UST and vent lines excavations are also provided in Attachment A.

On July 2, 2002, Testwell collected a groundwater sample from the bottom of the UST excavation. Analysis of the groundwater detected a number of VOCs above NYSDEC guidance values. However, turbidity of the sample may adversely affect the data. Therefore, a well point was also installed in the southeastern portion of the former UST

excavation to further assess groundwater quality near the former USTs. The well point will be incorporated into a site-wide groundwater investigation (see Recommendations).

Following the removal of the additional sidewall material and the remaining vent lines, end point soil samples were collected by Gannett Fleming. End point soil samples were comprised of one composite soil sample collected from three locations along the northern wall and one grab soil sample from the southwest corner of the UST excavation, and two composite soil samples from the bottom and sidewall following the removal of the vent lines along the eastern sidewall of the UST excavation (see Figure 2). The soil samples were placed in an ice-filled insulated cooler and delivered to Ecotest Laboratories, Inc. (NYSDOH Certification ID#10320). Chain-of Custody protocols were followed for the handling and delivery of the soil samples.

The soil samples were submitted for analysis of VOCs and PAHs listed in Table 2 of the NYSDEC Spill Technology and Remediation Series (STARS) Memorandum #1. The data was compared to the Recommended Soil Cleanup Objectives (RSCOs) provided in the NYSDEC Technical Administrative Guidance Memorandum #4046 dated December 20, 2000. The analytical results are provided in Table 2.

The VOC analysis detected benzene at 120 microgram per kilogram (µg/kg), 1,2,4-trimethylbenzene at 11,000 µg/kg, and 1,3,5-trimethylbenzene at 5,900 µg/kg in the north wall composite (N Wall Comp) sample at concentration above their respective NYSDEC RSCOs. The sidewall and bottom samples where the vent piping was removed (Sample Vent X Sidewall and Vent X Bottom) each detected benzene only at 110 µg/kg, above the RSCO of 60 µg/kg. No VOCs were detected above the NYSDEC RSCOs in the sample from the southwestern corner (Sample SE-RS) of the former UST excavation.

Analysis of PAHs detected benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, and benzo(a)pyrene at concentrations above the NYSDEC RSCOs in the four soil samples. No other PAHs were detected above the RSCOs.

Spill #0204002: Stained Soil in Southwestern Portion of Site

As part of the current construction activities, subsurface obstructions (large pieces of concrete) were removed to allow underpinning for a new foundation to be performed. During the removal of obstructions on July 17, 2002, black stained soil exhibiting a strong petroleum odor was observed adjacent to the southwestern portion of the existing warehouse. Two soil samples, West Side of Bldg N and West Side of Bldg S, were collected by Testwell from the stained area. These samples were submitted to Long Island Analytical Laboratories, Inc. (NYSDOH Certification ID #0220326) for analysis of the Target Compound List (TCL) VOCs and semi-volatile organic compounds (SVOCs). A site plan showing the test pit location is provided on Figure 3.

Continued . . .

Gannett Fleming conducted a review of historical Sanborn maps identified a bulk petroleum storage and distribution terminal occupied this portion of the site in 1951. However, no additional information is currently available as to the type of petroleum products stored at the former facility.

On July 31, 2002, subsequent foundation work by Gilbane Construction excavated a pit approximately 135 feet north of the stained area identified on July 17th. No staining or petroleum odors were reported in this excavation (see photos in Attachment A); however, no soil samples were collected.

On August 2, 2002, Gannett Fleming directed the excavation of six additional test pits (identified as TP-1 through TP-6) surrounding the location of stained soil observed on July 17th. Test pits were excavated at approximate 30-foot intervals until PID readings from the unsaturated soil remained at background levels. The excavated material was screened using a photo-ionization detector (PID).

The test pits were excavated to approximately nine feet below grade, approximately one foot into the water table. The water table was inspected for indications of free-floating product. Other than a sheen on the groundwater, no free-floating product was observed in TP-1 through TP-6. Groundwater samples were not collected as part of this investigation.

Three grab samples were collected from the test pits exhibiting background PID readings; TP-3, TP-5, and TP-6. The samples were handled in the same manner as the UST excavation samples discussed above and submitted to Ecotest Laboratories, Inc. for analysis of STARS Memo #1 Table 2 parameters. The locations of the test pits are provided on Figure 3. Test pit logs including PID readings collected from the test pits are provided in Attachment B.

The analytical data from both Testwell and Gannett Fleming samples did not detect VOCs above the NYSDEC RSCOs. Analysis of PAHs detected benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, and dibenzo(a,h)anthracene at concentrations above the NYSDEC RSCOs in the five soil samples. Indeno(1,2,3-c,d)pyrene was detected at a concentration above the RSCO in one sample. No other SVOCs were detected above the RSCOs. Laboratory data is provided on Table 3. Laboratory data sheets are provided as Attachment C.

Conclusions

- Current end point sample data indicates concentrations of VOCs in the western and southern walls of the UST excavation are below the NYSDEC RSCOs.

Continued . . .

- Concentrations of benzene in the eastern side wall and benzene, 1,2,4-trimethylbenzene, and 1,3,5-trimethylbenzene in the northern side wall on the UST excavation remain above the RSCOs.
- Concentrations of SVOCs detected above the RSCOs were limited to the PAHs including benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, and benzo(a)pyrene, site wide.
- PAHs were detected above the RSCOs in 9 of 12 samples surrounding the UST excavation.
- No concentrations of VOCs were detected above the RSCOs in soil samples collected from the southwestern portion of the site.
- PAHs were detected above the RSCOs in 4 of 5 samples collected in the southwestern portion of the site.

The occurrence of PAHs in the soils at the FedEx Ground facility appear to be ubiquitous within the urban fill material (wood, brick, glass, concrete, soil, etc.) observed in the excavations and presumably placed on the site when first developed in the 1950's. Concentrations of PAHs in soil samples were consistent through out each impacted area in both the Testwell and Gannett Fleming data. Soil samples collected from areas away from the observed impacted areas also detected PAHs. The distribution of PAHs and consistency in their concentrations is indicative of the general fill quality found at the site.

Recommendations

The following recommendations are provided for both the former UST area and the southwestern portion of the site.

Former UST Area

- No further actions are recommended for soils south and west of the former UST area. VOCs were not detected above the NYSDEC RSCOs, and concentrations of PAHs appear characteristic of the urban filled placed at the site (see below).
- Additional delineation of VOC impacts is recommended north and east of the former UST area. The VOC delineation will be conducted using a Geoprobe unit to collect 12 samples within a 25-foot grid extending from the former UST excavation (Figure 4). Soil samples will be screened vertically in two-foot intervals using a PID. Selected samples will be submitted for laboratory analysis of VOCs based on the PID readings. Because of obstructions, this work will be conducted after the current construction activities are complete (expected by October 2002).
- A groundwater investigation will be conducted over the entire site to assess local groundwater quality and to determine possible impacts from the petroleum releases on site and offsite. The groundwater investigation will also provide hydrogeologic

Continued . . .

- characterization of the site. Six shallow monitoring wells; two wells located hydraulically upgradient of the UST area and the southwestern portion of the site, respectively, and four wells downgradient of the impacted areas. The wells will be
- installed in compliance with NYSDEC guidance including 15 feet of well screen straddling the top of the water table to allow detection of free-floating product, if any. As with the soil investigation described above, this work is expected to be conducted in October 2002. Proposed monitoring well locations are provided on Figure 5.
- An investigation of general site-wide PAH concentrations will be conducted to confirm the assertion that these compounds are ubiquitous to the urban fill at the site. Soil samples will be collected during the installation of monitoring wells outlined above. Soil samples will be collected and submitted for laboratory analysis as described for the delineation of VOC impacts provided above.

The investigation activities will be provided to the NYSDEC in a supplemental site investigation report. A remedial action plan will be provided with the supplemental site investigation report, if appropriate.

Please feel free to call with any questions.

Very Truly Yours,

GANNETT FLEMING ENGINEERS AND ARCHITECTS, P.C.

Dear Ms. Donaghey:

Enclosed please find the Laboratory Analysis Report(s) for sample(s) received on July 19, 2002. Long Island Analytical Laboratories, Inc. analyzed the samples on July 23, 2002 for the following:

CLIENT ID	ANALYSIS
West Side of Building N	EPA 8021, EPA 8270, Lead
West Side of Building S	EPA 8021, EPA 8270, Lead

If you have any questions or require further information, please call at your convenience. Long Island Analytical Laboratories would like to thank you for the opportunity to be of service to you.

Best Regards,

Long Island Analytical Laboratories, Inc.

PETROLEUM BULK STORAGE APPLICATION – SECTION B – TANK INFORMATION – CODE KEYS

Action (1)

1. Initial Listing
2. Add Tank
3. Close/Remove Tank
4. Information Correction
5. Recondition/Repair/ Reline Tank

Tank Location (3)

1. Aboveground-contact w/soil
2. Aboveground-contact w/ impervious barrier
3. Aboveground on saddles, legs, stilts, rack, or cradle
4. Aboveground with 10% or more below ground
5. Underground
6. Aboveground in Subterranean Vault w/ access for inspections

Status (4)

1. In-service
2. Temporarily out-of-service
3. Closed-Removed
4. Closed- In Place
5. Tank converted to Non-Regulated use

Under Dispenser Containment (UDC) – sump/containment underneath a motor fuel dispenser (21)

Check If Present

Tank Owned by Party Other Than Listed in Section a (22)

Check If Applicable

Product Stored (7)

Re: Requesting search of records for Spill # 0202804

Dear Mr. Millard:

We are in receipt of your Foil request for the above referenced site. The identification Numbers Assigned is R2-10-355.

If for any reason you need to contact us again please use these numbers. When the programs are done gathering the files/information, this office will contact you.

Please expect our response within 20 days from the date of this letter.

If you have any questions, please call my secretary Cynthia Whiting/or Gloria Silva at 718-482-4507.

Sincerely yours,

Fawzy I. Abdelsadek, Ph.D., P.E.
Regional Enforcement Coordinator

NYS Department of Environmental Conservation

Commissioner

FOIL Request No. 10-596
3/18/2010

Mr. Joshua Millard
AECOM Environment
2 Technology Park Drive
Westford, MA 01886-

Dear Mr. Millard:

This is to acknowledge receipt of your Freedom of Information Law request seeking records regarding: ***FEDEX - 300 Maspeth Avenue, Brooklyn, NY. (Spill No. 0202804, facility No. 235924)***

I have referred your request to the following Records Custodian(s) / Freedom of Information Law Coordinator(s) who may possess the records you are requesting:

Ms. Valerie Gibson - Environmental Remediation
625 Broadway
Albany, NY 12233-7012 (518) 402-9757

Dr. Fawzy Abdelsadek - Region 2
2 Hunters Point Plaza 4740 21st Street
Long Island City, NY 11101-5407 (718) 482-4507

Ms. Pauline Morrissette - Solid and Hazardous Materials
625 Broadway
Albany, NY 12233-7250 (518) 402-8712

You may expect a response to your request by **4/15/2010.**

If I can be of further assistance, please contact me at (518) 402-9522 . Refer to request number ***10-596*** , if you write or call.

Sincerely,

Ruth L. Earl
Records Access Officer

APPLICATION FOR ACCESS TO RECORDS

(See Instructions on Reverse Side)

APPLICANT

TO THE DEPARTMENT OF ENVIRONMENTAL CONSERVATION:

I hereby apply to inspect the following records under the provisions of the Freedom of Information Law:

Address of Facility or Site (If applicable)
FEDEX, 300 Maspeth Ave., Brooklyn, NY

Spill No. (If applicable) 0202804 Facility ID No. (If applicable) 0202804

PBS No. (If applicable)

Other: NY Spills S106004598

Site ID 205400

DER Facility ID 235924

After inspection, should I desire copies of all or part of the records inspected, I will identify the records to be copied and hereby offer to promptly pay the established fees. (Cost of reproduction or 25¢ per page as applicable). Contact me if cost will exceed $ $250.00

Name (Print or type) Joshua C. Millard Telephone No. 978-589-3238 Fax No. 978-589-3705

Company (If applicable) AECOM Environment E-Mail Address joshua.millard@aecom.com

Mailing Address 2 Technology Park Drive, Westford, MA 01886

Signature Joshua C. Millard Date March 10, 2010

RECORDS RESPONSE

TO APPLICANT

RECORDS PROVIDED

The reproduction costs for the records provided $

Re: Requesting search of records for Spill # 0202804

Dear Mr. Millard:

NYSDEC/Region 2 has reviewed your request for the above referenced records under New York State's Freedom of Information Law (FOIL). Please note that most of our records are filed by number under the names of individuals or corporations. We have no way of locating or retrieving records if they are filed under names or addresses other than those you have provided.

If no records have been located, this does not necessarily mean, and should not be interpreted to mean that there have never been any violations, complaints, claims, investigations or inquiries involving those names or addresses. We cannot make any representations as to whether there are or have been any such violations, complaints, claims, investigations or inquiries.

☒ after a diligent search of Region 2 available files, no records could be located for the names and /or addresses you provided.

Thank you for your request. If additional information is needed, please call my Secretary/ Gloria Silva/Or Cynthia Whiting at (718) 482-4507, or fax your response to me.

Sincerely yours,

Fawzy I. Abdelsadek, Ph.D., P.E.
Regional Enforcement Coordinator

DEC REMARKS:

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "SAWYER"
12/11/2002-Vought-Called Ugene Martin and left message to call Demeo or Vought. Also called Dr. Eli N. Avila (917-848-4889) who is owner of property along with Banco Popular and according to Mr. Avila on 4/9/99 there was a large oil spill in basement by Robani Oil and Crystal Oil (subcontractor). According to Dr. Avila: Robani Oil's president (Mr. Robert Pearson-owner) came to site and told Avila that delivery could not be performed due to crack in whistle and that he would have to fix whistle. Mr. Avila told Mr. Pearson to fix whistle. Pearson came to site and replaced fill pipe instead of whistle. As a result basement was filled during delivery event. Robani was called and performed site visit. Free product was removed and sorbent was placed down. Odors still persist till this day. Mr. Avila called hotline in 4/99 and spoke to a Mr. Greene who referred him to DEP. DEP performed site vist and fined Mr. Robani for discharge to sewer. Mr. Avila is currently going to court for damages. Dr. Martin came and performed soil borings and sent soil samples for analysis.

NYSDEC SPILL REPORT FORM

DEC REGION: 2 **SPILL NUMBER:** 0209311

SPILL NAME: MR. AVILA **DEC LEAD:** aaobliga

12/17/2002-Vought-Site visit by Vought. Visual inspection of basement shows oil stains 2" above grade on drywall. Weathered fuel oil odors present in basement. One 1'x 1' excavation with water at depth of 6". No odor or sheen to water. On-site were Dr. Avila and Eugene Martin (consultant). According to Dr. Avila: 1) his lawyer will send him a copy of affadavit regarding admission of liability against Crystal and Robani oil companies 2) Robani/Crystal performed four soil borings in 4/02 3) Eugene Martin (consultant hired by Dr. Avila) performed four soil borings in 5/02. 4) no one is currently living in residence due to odors. NYSDEC requested of Dr. Avila: 1) Boring site plan and analyticals 2) affadavit from judge and all other documents regarding court decisions 3) copy of delivery receipt. NYSDEC inspected neighboring properties at 58 Hamilton Terrace (Troy White 212-694-0445) and Childrens Art Carnival at 62 Hamilton Terrace (Marline Martin 212-234-4093) and found no detectable odors or petroleum impacts.

12/20/02-Vought-Received boring site plan from Martin Geochemistry.

12/23/2002-Vought-Received affadavit, delivery receipt and analyticals from Dr. Avila.

1/8/2003-Vought-Review of documents provided by Dr. Avila. Vought spoke with Randall Austin who directed Vought to 1) investigate the call made to Mr. Greene at spills hotline on 4/9/99 and 2) foward file to David Rubinton (NYSDEC legal for review). Vought called Avila and left him message of directive.

1/8/2003-Vought-Vought instructed by Rubinton to contact RP to give them opportunity to clean spill. Vought called Robani Oil 212-687-8699 and left message for Mr. Pearson to call NYSDEC. Vought called Crystal Transportation 718-828-3100 and spoke with Mr. Frank Rizzo who said that message would be passed on to company owners. Mr. Rizzo could not say whether NYSDEC would receive a call back from Crystal and that further inquiries should be fowarded to Robani.

1/8/2003-Vought-Spoke with Robert Pearson who will turn call over to Chris Foley (attorney). Mr. Pearson stated that Robani will not institute remedial acivities due to possiblity of previous spills at Site. Vought also spoke with Rubinton who said to fill out case initiation form and send it to Region 2 legal.

1/9/2003-Vought-Gave case intiation form to David Rubinton (Region 2-legal). Vought spoke with supervisor Rommel who instructed to send do work letters to both oil companies and respective lawyers. Vought called Dr. Avila and informed him of case intiation and sending of do work order to Crystal, Robani and respective lawyers. Do work letters sent by Vought on 1/9/2003.

1/10/2003-Vought-Received letter fom Foley stating "they were interested in discussing and potentially resolving" issues of 1/9/2003 do work letter.

1/13/2003-Vought-Received fax from Chirstopher Foley (representing Robani Energy) who stated that after he spoke with representation of Crystal Transportation a contractor would be called to perform remediation. Vought recevied call from Brian Campbell (Vertex Engineering 781-952-6047) stating that he was called by Foley and was requesting list of contractors. Campbell will supervise contractors. Vought faxed list on 1/13/2003 and also suggested to Campbell that he contact Eugene Martin. Campbell will call back NYSDEC with contractor decision. Vought also gave Campbell names and contacts at NY State Dept of Health to certify reoccupation.

1/13/2003-Vought-Received message from Matt Spears (Kressner 718-584-8484) representing Dr. Avila requesting FOIL information. Vought called and left Spears message. Vought also received message from Eric Slessinger (Caroll & Mcnulty-212-868-9090x405) reresenting Crystal Transportation. Vought called Slessinger and left message to call NYSDEC.

1/14/2003-Vought-Received message from Spears requesting foil information. Vought called Spears and suggested postponing FOIL request until decision arrives from Foley and Robani Energy. Vought told Spears to call 1/21 for updates (after due date on Do Work letter) sent 1/9/2003.

1/15/2003-Vought-Received message from Eric Slessinger. Vought called Slessinger who received letter and said that he will call Rubinton to discuss legal issues. Slessinger stated that it would be difficult to obtain contactor by due date on Due Work letter because they were looking to seek action against other oil companies which delivered to Site before spill event. Vought will contact Rubinton before PIN job is opened.

1/17/2003-Vought-Received message from Foley. Vought called Foley and left message. Foley returned call who was in court on 1/16. According to Judge Marcy Friedman Robani/Crystal will have time before trial to clean spill. Trial is scheduled for 3/24/2003. Foley has called Miller and Milro and scheduled a possible site visit for Wed 2/22/2003. Vought called Avila and notified him of possible site visit date. Vought will call Kressner to facilitate site visit.

1/21/2003-Vought-Spoke to Foley and contractors will be Milro and Brookside. Will attempt to arrange site for tommorrow (212-363-1300) despite lack of response from Kressner or Avila. Vought called Kressner to facilitate visit and left message to return call to NYSDEC. Vought spoke with Kressner and site visit is arranged for tomorrow. Kressner left message for Foley approving of site visit.

2/4/2003-Vought- Spoke with Dr. Martin performed test bore under 58 Hamilton on 1/29/03 and found PID reading of 5ppm. Sample will be sent for analysis and will fax me analyticals. Vought called Foley (212-363-1300) for update on contractors and left message to call Vought back. Vought called Kressner and he is skeptical of results and does not believe in state supervision. Vought called Dr. Avila. According to Dr. Avila three consulting companies performed a site visit and no proposals were submitted. Vought will attempt to arrange meeting between Kressner, Foley, RObani, Avila, DOH, Landmarks, Martin to prevent PIN project from being opened. Vought arranged meeting for 2/27/2003.

2/5/2003-Vought-Received letter from Foley asking if DEC was instructing them to refrain from proceeding with

remediation until 2/27/2003 meeting.

2/7/2003-Vought-Letter sent by NYSDEC (Rubinton) to Kressner stating that failure of Avila to take actions to address petroleum discharges would subject Avila to liabilities as a responsible party.

2/11/2003-Vought-NYSDEC sent letter to Foley that pre-hearing conference for 2/19 is adjourned due to scheduled 2/27 meeting.

2/20/2003-Vought-Work proposals submitted by Brookside Environmental (environmental consultant) and H2M (structural engineer).

2/26/2003-Vought-Send work proposal review letter to Brookside and all involved parties requiring STARS 8260/8270 analyes, collection of endpoint samples, description of sampling methods, scaled Site plan and concrete encapsulation.

2/27/2003-Vought-Meeting at NYSDEC with Kressner,Foley , Stapleton, Landmarks, NYC Dept. of Heath, Martin, Robani. Meeting. All parties agreed that a structual engineer report will be produced by Vertex engineering (Scott Hamarich 631-758-1580). Vertex will be supervising Brookside. Engineer report will be sent to Landmarks and then to Dept. of Buildings for approval who will review report by 3/21. Copies of report will also be sent to DEC and Kressner. Brookside will also produce addendum to scope of work incorporating NYSDEC 2/26 proposal review letter comments.

3/7/2003-Vought-Received proposal from H2M (Michael McKeown-631-756-8000) who is structural engineer hired by Robani. Proposal approves basement excavation and aslo said that boring was performed by H2M and bedrock is at 2.5'. Vought sent letter to Dr. Martin requesting all previous boring logs, sample analyticals and sample depths.

3/18/2003-Vought-Spoke with Brian Stapleton submitted report to Kressner on 3/10. Stapleton has not yet received response from Kressner. Vought told Stapleton that Landmarks and DOB approval of structural report and final draft workplan to NYSDEC were needed as stated in meeting.

4/30/2003-Vought-Spoke with Dr. Avila who inquired about next step for remedial action despite private lawsuit between Avila and Oil companies. Vought told Avila to call Rubinton because Rubinton told Vought not to take any action until Rubinton gave approval.

12/10/03 - AUSTIN - PROJECT TRANSFERRED FROM VOUGHT TO SAWYER - END

NYSDEC SPILL REPORT FORM

DEC REGION: 2 **SPILL NUMBER:** 0209311

SPILL NAME: MR. AVILA **DEC LEAD:** aaobliga

12/2/04 - Sawyer - Received work proposal on 10/21 from Vinny at Island Environmental Tank.

1/6/05 - Sawyer - Talked to Melanie at Island Environmental Tank and answered her questions about offsite contamination. The subsurface investigation and delineation will encompass all areas associated with the spill.

5/31/05 - reassigned to Vought by Koon Tang since DEE needs technical support for enforcement action, and Chris Sawyer has just left the Department. - KST

9/12/05 - Obligado - Site transferred from Vought to Obligado.

NYSDEC SPILL REPORT FORM

DEC REGION#: 2 **SPILL NUMBER:** 0202804

SPILL NAME: **DEC LEAD:** JBVOUGHT

Prior to Sept, 2004 data translation this spill Lead_DEC Field was "VOUGHT"

10/15/04-Vought-File review by Vought:

Access Agreement-7/10/02. Access agreement for FedEx to remove USTs and portion of tankfield on adjacent property.

Letter from Testwell Labs(Pearce) to FedEx(Swart)-7/10/02. Work proposal for installation of nine soil borings, field screening of soil samples, conversion of three of the borings into monitoring wells, quarterly sampling of the wells and further excavation of the soil and piping.

Letter from Testwell Labs(Pearce) to DEC Vought-7/22/02. Soil "samples were taken from the walls and groundwater after the underground fuel storage tanks and surrounding had been removed..." Testwell recommends: 1)backfilling of UST excavation 2)SVOC's are due to fill material 3)if wells are deemed necessary "they are to be installed at a later date after site work (piles and foundations) is complete" 4)remaining vent lines terminate at surface level and remaining contaminated soil on adjacent property should be removed.
Letter from Gannett Fleming (Ernst) to DEC Vought-8/13/02. "This letter is intended to inform the NYSDEC of the projected site remediation activities." "Based on the endpoint soil data (samples WSW and SSW no further action is recommended for the soil beneath facility footprint which is currently under construcion". No groundwater monitoring wells are proposed inside the facility." Gannett Fleming will provide a comprehensive site investigation report on both the UST removal and for the "black tar like substance found in the southwestern portion of the site".

Report from Gannett Fleming to DEC Vought-8/28/04. "This letter provides a summary of the additional investigation activities and sample analysis that have taken place....." Removal of twenty (550-gallon) gasoline USTs and 900 tons of impacted soil. See above 7/22/02 entry for endpoint analyticals. Soil analyticals show 7750ppb 1,3,5-trimethylbenzene(WSW Wall) and 6470ppb xylene(WSW Wall), 110ppb benzene(vent x bottom), 110ppb benzene(Vent x sw), 120ppb benzene(n wall composite), 5900ppb 1,3,5-trimethylbenzene(n wall composite), 11000ppb 1,2,4-trimethylbenzene(n wall composite). Groundwater analytical from one well shows 40ppb benzene and 26ppb xylene. "Black stained soil exhibiting a strong petroleum odor was observed adjacent to the southwestern portion of the existing warehouse". Seven test pits were dug to delineate the stained soil but no groundwater samples were collected. Report recommends: 1)no further actions for soils south and west of the former UST area 2)additional delineation north and east of the former UST area via Geoprobe 3)installation of six montoring wells (two upgradient and four downgradient). Investigation activities will be provided to DEC in a supplemental site investigation report. Soil analyticals shos PAH exceedences throughout site due to fill material.

Report from Gannett Fleming to DEC Vought-6/8/04. "This letter report documents the results of investigative activities conducted...." "A review of historic Sanborn maps indicate a Brooklyn Union Gas bulk petroleum storage and distribution terminal was present in the southwestern portion of the site in 1951. Installation of six monitoring wells. An additional well was installed to replace a well destroyed in the tankfield excavation. Groundwater at a depth of 8' below grade. "..groundwater flows to the north in the northern portion of the site. Groundwater flows converge to the east in the southern portion of the site". Groundwater analyticals show 21ppb ethylbenzene(MW1), 13ppb 1,3,5-trimethylbenzene(MW1), 97ppb napthalene(MW1), 10ppb benzene(MW2), 7ppb ethylbenzene(MW2), 93ppb napthalene(MW2), 20ppb benzene(MW7), 7ppb ethylbenzene(MW7), 35ppb xylene(MW7), 52ppb napthalene(MW7). Soil analyticals showed no VOC exceedences and SVOC exceedences attributable to fill material. Report recommends: 1)no further action with respect to soil 2)no further action for onsite groundwater due to "poor regional groundwater quality". Report requests no further action. DEC requires: 1)one full year of groundwater monitoring prior to closure.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDRs professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1928 through 2005. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 100 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL LIENS ---------- Federal Superfund Liens

Federal Delisted NPL site list

Delisted NPL ---------- National Priority List Deletions

Federal CERCLIS list

FEDERAL FACILITY ---------- Federal Facility Site Information listing

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF ---------- RCRA - Treatment, Storage and Disposal

Federal institutional controls / engineering controls registries

US ENG CONTROLS ---------- Engineering Controls Sites List

US INST CONTROL ---------- Sites with Institutional Controls

Federal ERNS list

ERNS ---------- Emergency Response Notification System

State and tribal leaking storage tank lists

INDIAN LUST ---------- Leaking Underground Storage Tanks on Indian Land

State and tribal registered storage tank lists

INDIAN UST ---------- Underground Storage Tanks on Indian Land
FEMA UST ---------- Underground Storage Tank Listing

State and tribal institutional control / engineering control registries

ENG CONTROLS ---------- Registry of Engineering Controls
INST CONTROL ---------- Registry of Institutional Controls
RES DECL ---------- Restrictive Declarations Listing

State and tribal voluntary cleanup sites

INDIAN VCP ---------- Voluntary Cleanup Priority Listing

State and tribal Brownfields sites

ERP ---------- Environmental Restoration Program Listing

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS ---------- A Listing of Brownfields Sites

Local Lists of Landfill / Solid Waste Disposal Sites

ODI ---------- Open Dump Inventory
DEBRIS REGION 9 ---------- Torres Martinez Reservation Illegal Dump Site Locations
SWTIRE ---------- Registered Waste Tire Storage & Facility List
INDIAN ODI ---------- Report on the Status of Open Dumps on Indian Lands

Local Lists of Hazardous waste / Contaminated Sites

US CDL ---------- Clandestine Drug Labs
US HIST CDL ---------- National Clandestine Laboratory Register

Local Lists of Registered Storage Tanks

HIST AST ---------- Historical Petroleum Bulk Storage Database

Local Land Records

LIENS 2 ---------- CERCLA Lien Information

LUCIS ---------- Land Use Control Information System

Other Ascertainable Records

DOT OPS ---------- Incident and Accident Data
DOD ---------- Department of Defense Sites
FUDS ---------- Formerly Used Defense Sites
CONSENT ---------- Superfund (CERCLA) Consent Decrees
ROD ---------- Records Of Decision
UMTRA ---------- Uranium Mill Tailings Sites
MINES ---------- Mines Master Index File
TRIS ---------- Toxic Chemical Release Inventory System
TSCA ---------- Toxic Substances Control Act
FTTS ---------- FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)
HIST FTTS ---------- FIFRA/TSCA Tracking System Administrative Case Listing
SSTS ---------- Section 7 Tracking Systems
ICIS ---------- Integrated Compliance Information System
PADS ---------- PCB Activity Database System
MLTS ---------- Material Licensing Tracking System
RADINFO ---------- Radiation Information Database
RAATS ---------- RCRA Administrative Action Tracking System
UIC ---------- Underground Injection Control Wells
DRYCLEANERS ---------- Registered Drycleaners
NPDES ---------- State Pollutant Discharge Elimination System
AIRS ---------- Air Emissions Data
E DESIGNATION ---------- E DESIGNATION SITE LISTING
INDIAN RESERV ---------- Indian Reservations
SCRD DRYCLEANERS ---------- State Coalition for Remediation of Drycleaners Listing
PCB TRANSFORMER ---------- PCB Transformer Registration Database

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 03/31/2011 has revealed that there is 1 NPL site within approximately 1 mile of the target property.

Federal CERCLIS list

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 02/25/2011 has revealed that there are 2 CERCLIS sites within approximately 0.5 miles of the target property.

Federal CERCLIS NFRAP site List

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List

(NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 02/25/2011 has revealed that there are 5 CERC-NFRAP sites within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/09/2011 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/11/2011 has revealed that there are 7 RCRA-LQG sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/11/2011 has revealed that there are 4 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/11/2011 has revealed that there are 4 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the SHWS list, as provided by EDR, and dated 05/24/2011 has revealed that there are 9 SHWS sites within approximately 1 mile of the target property.

VAPOR REOPENED: "Vapor intrusion" refers to the process by which volatile chemicals move from a subsurface source into the indoor air of overlying or adjacent buildings. The subsurface source can either be contaminated groundwater or contaminated soil which releases vapors into the pore spaces in the soil. Improvements in analytical techniques and knowledge gained from site investigations in New York and other states has led to an increased awareness of soil vapor as a medium of concern and of the potential for exposures from the soil vapor intrusion pathway. Based on this additional information, New York is currently re-evaluating previous assumptions and decisions regarding the potential for soil vapor intrusion exposures at sites. As a result, all past, current, and future contaminated sites will be evaluated to determine whether these sites have the potential for exposures related to soil vapor intrusion.

A review of the VAPOR REOPENED list, as provided by EDR, and dated 09/14/2010 has revealed that there is 1 VAPOR REOPENED site within approximately 1 mile of the target property.

State and tribal leaking storage tank lists

LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the LTANKS list, as provided by EDR, and dated 05/24/2011 has revealed that there are 44 LTANKS sites within approximately 0.5 miles of the target property.

HIST LTANKS: A listing of leaking underground and aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills. In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY LTANKS database.

A review of the HIST LTANKS list, as provided by EDR, and dated 01/01/2002 has revealed that there are 32 HIST LTANKS sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

TANKS: This database contains records of facilities that are or have been regulated under Bulk Storage Program. Tank information for these facilities may not be releasable by the state agency.

A review of the TANKS list, as provided by EDR, and dated 04/05/2011 has revealed that there is 1 TANKS site within approximately 0.25 miles of the target property.

CBS UST: Chemical Bulk Storage Database. Registration data collected as required by 6 NYCRR Part 596. It includes facilities storing hazardous substances listed in 6 NYCRR Part 597, in aboveground tanks with capacities of 185 gallons or greater, and/or in underground tanks of any size. Includes facilities registered (and closed) since effective date of CBS regulations (July 15, 1988) through the date request is processed.

A review of the CBS UST list, as provided by EDR, and dated 01/01/2002 has revealed that there is 1 CBS UST site within approximately 0.25 miles of the target property.

MOSF UST: Major Oil Storage Facilities Database. Facilities are licensed pursuant to Article 12 of the Navigation Law, 6 NYCRR Part 610 and 17 NYCRR Part 30. These facilities may be onshore facilities or vessels, with petroleum storage capacities of 400,000 gallons or greater. Includes MOSF's licensed or closed since April 1, 1986, (responsibility was transferred from DOT on October 13, 1985) plus available data obtained from DOT facilities licensed since Article 12 became law on April 1, 1978.

A review of the MOSF UST list, as provided by EDR, and dated 01/01/2002 has revealed that there are 4 MOSF UST sites within approximately 0.5 miles of the target property.

Local Lists of Registered Storage Tanks

HIST UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Conservation's Petroleum Bulk Storage (PBS) Database

A review of the HIST UST list, as provided by EDR, and dated 01/01/2002 has revealed that there are 26 HIST UST sites within approximately 0.25 miles of the target property.

Records of Emergency Release Reports

NY Spills: Data collected on spills reported to NYSDEC. is required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, and dated 05/24/2011 has revealed that there are 33 NY Spills sites within approximately 0.125 miles of the target property.

NY Hist Spills: This database contains records of chemical and petroleum spill incidents. Under State law, petroleum and hazardous chemical spills that can impact the waters of the state must be reported by the spiller (and, in some cases, by anyone who has knowledge of the spills). In 2002, the Department of Environmental Conservation stopped providing updates to its original Spills Information Database. This database includes fields that are no longer available from the NYDEC as of January 1, 2002. Current information may be found in the NY SPILLS database.

A review of the NY Hist Spills list, as provided by EDR, and dated 01/01/2002 has revealed that there are 24 NY Hist Spills sites within approximately 0.125 miles of the target property.

Other Ascertainable Records

RCRA-NonGen: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA-NonGen list, as provided by EDR, and dated 03/11/2011 has revealed that there are 25 RCRA-NonGen sites within approximately 0.25 miles of the target property.

HSWDS: The List includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity The latest version of the study is frozen in time. The sites on the study will not automatically be made superfund sites, rather each site will be further evaluated for listing in the registry. So overtime they will be added to the registry or not.

A review of the HSWDS list, as provided by EDR, and dated 01/01/2003 has revealed that there are 7 HSWDS sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the Manufactured Gas Plants list, as provided by EDR, has revealed that there are 3 Manufactured Gas Plants sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
EQUITY WORKS	MASPETH AND VANDERVORT	WSW 0 - 1/8 (0.017 mi.)	D315	131

Registry ID: 110040085902

Environmental Interest/Information System
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

DEC Region: 2
DER Facility ID: 235924
DEC Memo: Sangesland spoke to Dan at Miller. He said there was a spill in the FEDEX parking lot from 20 gal diesel from a delivery truck. Vac truck is sucking out the drain. Because of the rain earlier today there was standing water in the sump and the product was floating on top of the water. Speedie Dry was applied to the parking lot area. 3PM Everything is now cleaned up and Miller is packing up their gear and leaving.
Remarks: Caller states a leaking fuel tank on a truck caused fuel to spill onto the parking lot and ran into a storm sewer. Miller environmental is cleaning up.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Region:	2
DER Facility ID:	235924
DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "VOUGHT" 10/15/04-Vought-File review by Vought: Access Agreement-7/10/02. Access agreement for FedEx to remove USTs and portion of tankfield on adjacent property. Letter from Testwell Labs(Pearce) to FedEx(Swart)-7/10/02. Work proposal for installation of nine soil borings, field screening of soil samples, conversion of three of the borings into monitoring wells, quarterly sampling of the wells and further excavation of the soil and piping. Letter from Testwell Labs(Pearce) to DEC Vought-7/22/02. Soil "samples were taken from the walls and groundwater after the underground fuel storage tanks and surrounding had been removed..." Testwell recommends: 1)backfilling of UST excavation 2)SVOC's are due to fill material 3)if wells are deemed necessary "they are to be installed at a later date after site work (piles and foundations) is complete" 4)remaining vent lines terminate at surface level and remaining contaminated soil on adjacent property should be removed. Letter from Gannett Fleming (Ernst) to DEC Vought-8/13/02. "This letter is intended to inform the NYSDEC of the projected site remediation activities." "Based on the endpoint soil data (samples WSW and SSW no further action is recommended for the soil beneath facility footprint which is currently under construcion". No groundwater monitoring wells are proposed inside the facility." Gannett Fleming will provide a comprehensive site investigation report on both the UST removal and for the "black tar like substance found in the southwestern portion of the site". Report from Gannett Fleming to DEC Vought-8/28/04. "This letter provides a summary of the additional investigation activities and sample analysis that have taken place....." Removal of twenty (550-gallon) gasoline USTs and 900 tons of impacted soil. See above 7/22/02 entry for endpoint analyticals. Soil analyticals show 7750ppb 1,3,5-trimethylbenzene(WSW Wall) and 6470ppb xylene(WSW Wall), 110ppb benzene(vent x bottom), 110ppb benzene(Vent x sw), 120ppb benzene(n wall composite), 5900ppb 1,3,5-trimethylbenzene(n wall composite), 11000ppb 1,2,4-trimethylbenzene(n wall composite). Groundwater analytical from one well shows 40ppb benzene and 26ppb xylene. "Black stained soil exhibiting a strong petroleum odor was observed adjacent to the southwestern portion of the existing

FEDEX (Continued) **S106004598**

warehouse". Seven test pits were dug to delineate the stained soil but no groundwater samples were collected. Report recommends: 1)no further actions for soils south and west of the former UST area 2)additional delineation north and east of the former UST area via Geoprobe 3)installation of six montoring wells (two upgradient and four downgradient). Investigation activities will be provided to DEC in a supplemental site investigation report. Soil analyticals shos PAH exceedences throughout site due to fill material. Report from Gannett Fleming to DEC Vought-6/8/04. "This letter report documents the results of investigative activities conducted...." "A review of historic Sanborn maps indicate a Brooklyn Union Gas bulk petroleum storage and distribution terminal was present in the southwestern portion of the site in 1951. Installation of six monitoring wells. An additional well was installed to replace a well destroyed in the tankfield excavation. Groundwater at a depth of 8' below grade. "..groundwater flows to the north in the northern portion of the site. Groundwater flows converge to the east in the southern portion of the site". Groundwater analyticals show 21ppb ethylbenzene(MW1), 13ppb 1,3,5-trimethylbenzene(MW1), 97ppb napthalene(MW1), 10ppb benzene(MW2), 7ppb ethylbenzene(MW2), 93ppb napthalene(MW2), 20ppb benzene(MW7), 7ppb ethylbenzene(MW7), 35ppb xylene(MW7), 52ppb napthalene(MW7). Soil analyticals showed no VOC exceedences and SVOC exceedences attributable to fill material. Report recommends: 1)no further action with respect to soil 2)no further action for onsite groundwater due to "poor regional groundwater quality". Report requests no further action. DEC requires: 1)one full year of groundwater monitoring prior to closure. 10/18/04-Vought-Sent letter with above requirement. 9/27/05 - Obligado - SITE TRANSFERRED FROM VOUGHT TO OBLIGADO 9/30/05 - Obligado - Called Manfred Bohms, left message. 10/03/05 - Obligado - Spoke with Manfred Bohms (516) 671-8440. Said that a final quarterly monitoring report should be received by Department in a few weeks. 11/7/05 - Obligado - Review final quarterly monitoring report. Ground water results show 28 ppb benzene (MW1), 28 ppb ethylbenzene (mw1), 10 ppb xylenes (mw1), 3 ppb benzene (mw3), 34 ppb benzene (mw7), 6 ppb toluene (mw7), 32 ppb xylenes (mw7), 150 ppb napthalene (mw7). Conclusions: GW data indicate ground water contmaination is stagnant. GW flow and quality have remained consistent throughout monitoring program. Stagnant gw plume indicate groundwater impacts "representative of regional groundwater quality". Requests no further action. Will discuss with Joe Sun. 12/22/05 - Obligado - Spoke with Koon. Approves NFA. Minor residual contamination possibly coming from offsite - former Brooklyn Union is across the street. Spill closed. Letter sent.

Remarks: they were excavating a previously closed tank & came across it by the piping - they will excavate & stock pile the soil

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Alias Comments: Not reported
Site Description: Oil refinery containing approximately one half million gallons of PCB containaminated waste oil. The owner has been in negotiations with the NYSDEC, but has decided to walk away and have the government perform the cleanup. The site has been determined to be removal eligible. Richard Gardineer, from DEP informed EPA that DEP wants to wait for the removal action results before doing a PA at the site.

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is

BCF OIL REFINING, INC. (Continued) **1000272490**

used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Assessment of Health:	Persons who dig below the ground surface may come into contact with soil and groundwater contaminated with volatile organic compounds. People are not exposed to contaminants in drinking water since the area is served by a public water supply. Also, they are not coming into contact with the groundwater unless they dig greater than 10 feet below the ground surface. Organic compounds in the soil and groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings is referred to as soil vapor intrusion. The potential exists for the inhalation of site-related contaminants in indoor air due to soil vapor intrusion for any future on-site construction.
Description:	The BCF Oil site is located within an urban, industrialized area of East Williamsburg, Brooklyn. Previously existing buildings and above ground storage tanks have been removed, and the property is being used as a Marshall’s impound lot. A National Grid facility borders the site on the north, Newtown Creek on the south, a city automobile impound lot on the east and a scrap metal processing facility on the west. The total area is 1.9 acres, of which 0.3 acres is land under water. The property was used as a petroleum distribution facility for many years, starting in the early 1900 s. In 1980, the terminal was modified for use as a waste oil processing facility, and was used for

BCF OIL REFINING, INC. (Continued) **1000272490**

waste oil recycling from 1980 to 1994. Routine sampling detected PCBs in the waste oil, and operations ceased in 1994. The property is zoned M3 (manufacturing/industrial), and it is currently used to store impounded automobiles. The site consists primarily of historic fill placed upon wetlands. Groundwater exists approximately 5 to 10 feet below grade and flows both to the north and south from the site. A remedial investigation of the site to determine the nature and extent of contamination has been completed. The site is currently being managed as a single operable unit. In addition, there is an open NYSDEC spill at this location; spill #9406807

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants.

DITMAS TERMINAL - 364 MASPETH AVE (Continued) **1000227109**

AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

DEC Region: 2
DER Facility ID: 102823
DEC Memo: 03/03/11 - LZ The February 14, 2011 RAWP (eDocs) has been approved 11/02/10 - LZ Has reviewed and approves a CEUS Engineering request for a 90-day extension to collect additional data, design a petroleum recovery system, and submit a revised remedial action work plan. The work plan to be submitted by January 31, 2011. In eDocs is the October 29, 2010 Third Quarter 2010 report. 10/12/10 - LZ The July 30, 2010, quarterly report (eDocs) by CEUS Engineering, P.C., proposes installation of recovery wells south of MW-2 where free product still exists. After five wells are installed, vacuum truck extraction will be performed and its results analyze to determine whether to continue weekly vacuuming or to install a recovery system. 04/22/10 - LZ Staff reviewed the March 31, 2010 report(eDocs)prepared by CEUS Engineering, P.C. To improve the effectiveness of bioremediation, CEUS Engineering proposes the complete extraction of free product. Vacuum-enhanced product recovery will be conducted using temporary extraction points in the vicinity of MW-2 until free product is removed, while the bioremediation process is suspended. Bioremediation will resume in the fall of 2010, utilizing monthly bio-applications, and the process will be monitored by sampling performed quarterly. Staff approved the proposed modifications to product recovery and bioremediation operations as well as the proposed schedule of the future activities requiring that vacuum-enhanced product recovery must be conducted at least weekly. 02/12/10 - LZ John Rhodes (phone 646-465-2494), since his comany CEUS took over the project, requested an extension to submit the report by March 31, 2010. Request granted. 10/27/09 - LZ Reviewed the AST quarterly report (eDocs) that covers April - June 2009 activities. Monthly gauging were conducted in 17 onsite and offsite wells. Well MW-2 exhibited free product during every gauging (0.006 -0.07 foot). 09/16/09 - LZ E-mailed Chris Tomasello of AST, LLC requesting a 2nd quarter 2009 report be submitted by September 22th. In addition to previous reports, this report should include the amount of recovered product and all, listed in TAGM 4046, VOCs, SVOCs, and MTBE being analyzed (we spoke about this in April). 05/04/09 - LZ The May 1, 2009, Advanced Site Restoration Quarterly Status Report (eDocs) covers remedial activities from January to April 2009. The monitoring well network was gauged on January 6, February 6, and March 4, 2009, and sampled on April 13, 2009. Gauging was performed at MW-2 through MW-6, MW-8, MW-10, MW-16, MW-17, MW-19, and MW-21.The groundwater samples were analyzed for VOCs, including BTEX and MTBE. Total BTEX concentrations ranged from non-detected to 350 ug/l (MW-10). MTBE concentrations ranged from non-detected to 11 ug/l (MW-21). Concentration of BTEX in excess of applicable NYSDEC GWQS were detected in 3 groundwater samples collected during this groundwater sampling event. The next sampling event is scheduled for July, 2009. LNAPL was last detected on March 6, 2009 in MW-2 and was bailed out

DITMAS OIL COMAPNY (Continued) **S103275710**

from this well. 05/04/09 - LZ The October-December 2008 quarterly report (eDocs) prepared by Advanced Site Restoration, indicates that 500 gallons of Bio Rem LLC H-10 were pumped monthly into the sit's bio-irrigation system. Since October 2006, total 53.5 gallons of LNAPL have been removed from the ground. Free product still exists in MW-2 and MW-17. Twelve wells (MW-2 through MW-6, MW-8, MW-10, MW-16, MW-17, and MW-19 through MW-21) were gauged on 10/01/08, 11/03/08, and 12/17/08. On October 1, 2008, monitoring wells MW-3 through MW-6, MW-8, MW-10, MW-16, and MW-19 were sampled: total BTEX concentration range was found from non-detected to 68 ug/l (MW-19); MTBE concentration range was found from non-detected to 9 ug/l(MW-5). 06/16/08 - LZ A report, dated April 2008, prepared by the ASR, provides data concerning remediation efforts and the level of current contamination at the site. From October 2006 to February 2008, 53.5 gallons of LNAPL has been extracted from groundwater. The ASR has applied 30,000 gallons of bio solution-BioREm H-10. Total BTEX has decreased in all monitoring wells, except MW-2. Free product is still in MW-2 and MW-17. 08/08/06 -Zielinski A site visit and a meeting with Mr. Tomasello of ASR. Sent a letter to Mr. Tomasello((see eDocs) requesting installation of three additional wells, reinstallation of MW1, MW11, and W9. 07/18/06 - Zielinski A review of the July 2006 monthly montoring report received from Advanced Site Restoration, LLC,(ASR) indicates that at wells MW-2 and MW-6 concentraction of benzene and total BTEX concentration is relatively high. Results from other seven wells indicate low contamination of groundwater. In August, staff will visit the site. In August, ASR will submit a quarterly report regarding the status of remedation process at the site. 08/18/04 - Zielinski In its letter of August 18, 2004, the department requested that the delineation of petrolum contamination had to be performed by Ditmas Oil Association. In addition, a remedial action plan must be submitted by the facility. These documents have not been received by the department, a review of files on July 5, 2006, shows. 4/21/04 - This project is re-assigned to Zhao from Sigona. Prior to Sept, 2004 data translation this spill Lead_DEC Field was "ZHAO" This site spill cleanup has been consolidated under Spill No. 9006603. 09/15/90: SPILLER WILL DISPOSE OF SOIL PROPERLY & ASSURE WARNING SYSTEM IS IN PROPER WORKING ORDER, SPILL TO BE REFERRED TO MOSF COORDINATOR. DEC Sigona performed follow-up investigation and discovered groundwater contamination. Site is under a consent order to performed remediation of groundwater and tidal wetlands.

Remarks: GASOLINE Spill into secondary containment - NYCDEP,USCG,NYCFD ON SCENE, ALARM FAILURE CAUSED PRODUCT TO EXIT THROUGH VENT IN FIRE EXTINGUISHING SYSTEM,APPROX 200 CU YDS OF CONTAMINATED SOIL.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and

ROCKOWER - SIGADEL ASSOCIATES (Continued) **1000290813**

corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DEC Remarks: On Thursday January 25, 1996, Dave Pulvermiller of MTS Environserve called A.Sigona and informed that the 550 gallon UST which failed a tank test would be removed along with two other 550 gallon gasoline USTs. They would be taking samples and doinga site assessment during the tank removal. The tanks will be registered and will submit a substantial modification application. The tanks will be removed the week of January 29, 1996, and DEC Sigona is planning to view the excavations on Tuesday January 30, 1996 at 3:30 PM. The consultant plans to sample and test using EPA method 8020.
Spill Cause: TEST METHOD NDE MODEL 1000, UNKNOWN LEAK RATE.

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FIS (New York - Facility Information System) is New York's Department of Environmental Conservation (DEC) information system for tracking environmental facility information found across the State.

US Facility Response Plan (FRP) contains plans for responding, to the maximum extent practical, to worst case discharges of oil.

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DER Facility ID:	106588
DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "ZHITOMIRSKY" 4/21/03. A. Zhitomirsky reported that about 1 foot of diesel accumulated in a GW monitoring well. URS was contacted to

ENGINE CO. 206 FDNY -DDC (Continued) **S106013243**

investigate and pump out the well. Y.K. It's a new spill at the same location. Diesel leaked from dispensers into the ground and was found in monitoring wells. Monitoring wells were vacuumed, were dispensers repaired and contaminated soil was removed. Alex Zhitomirsky visited the site on April 18, 2003. See also spill # 9703500. 4/18/2005 Request to terminate operation of SVE system was granted. GW monitoring will be continued on a quaterly basis. AZ 10/31/2005 Reviewed Free Product Recovery/Quaterly GW Monitoring Report through 2nd Quarter 2005. MW-1 had increase from 135 ppb (2/2005) to 186 (5/05) ppb in VOCs and from 102 ppb to 284 ppb. MW- 1 is sidegradient to the tank field and gw flow. There is no downgradient well to well MW-1. Free Product site. AZ 8/9/2006 Reviewed a report submitted by Greyhawk on Aug. 3, 2006. Roux recommended conduct one additional groundwater sampling round (MW-1), decommision SVE system and replace absorbent sock in MW-1. AZ 12/22/2006 At the meeting with DDC/Greyhawk on 12/12/2006 the remedial progress was discussed. Greyhawk will perform one more monitoring event with an absorbent sock. The absorbent sock will be removed immediately. AZ 12/08/2006 Reviewed a report submitted by Greyhawk on Nov. 20, 2006 for the period of July through September 2006. According to the report, URS stated that since November 2004, no product only product sheen had been encountered in MW-01. This well is located adjacent to the former source of the diesel fuel spill which has been from a faulty dispenser. According to the report: "However, petroleum absorbent socks placed in this monitoring well would have absorbed product that might otherwise have accumulated in a measurable quantity." On the other hand, Roux stating that "No free phase product or product sheen is currently detected in site monitoring wells." A petroleum absorbent sock is installed in MW-01 to absorb any product sheen that might collect in this well. MW- 1 was the only well sampled. The total concentration of VOC in MW-1 was 23 ppb. MW-3 and MW-4 had been removed from the sampling program after the first quarter of 2005 due to low concentrations of VOCs and SVOCs. Roux recommended terminate the monitoring program, close spills and remove the SVE system. AZ 4/18/2007 Reviewed October-December 2006 Monitoring Report dated March 15, 2007. Absorbent sock was removed from MW-1 on 10/26/07. An e-mail was sent to Roux/GReyhawk/DDC: I have reviewed the 4th quarter monitoring report for this site. Based on my review, I offer the following comments: The SVE system could be disassembled and removed from the site. As it was explained to Roux in our previous correspondence, request for a site closure should be preceded by a round of groundwater gaging and sampling which should include all monitoring wells. In meanwhile, Roux could reduce the sampling and gauging to semi-annual frequency at this site. AZ 2-10-2007 Reviewed January-June 2007 Monitoring Report. An e-mail was sent to DDC/Roux/VB:"I have reviewed semi-annual monitoring report submitted for the above site. Also, we have discussed this project over the phone. Roux suggested terminating the monitoring program and issue NFA for this site. However, monitoring wells MW-03 and MW-04 exhibited elevated concentrations of VOC. Apparently these wells previously did not exhibit any exceedances. According to Roux, no trends can be ascertained for total VOCs and SVOCs for these wells. Moreover, these wells are located directly downgradient from the former source of the spill, a faulty dispenser. Based on this information, I recommend performing another round of groundwater monitoring. AZ 8-10-2008 An e-mail was sent to DDC/Roux/Greyhawk/V. Brevdo: "I have reviewed report for the above site for the period of

ENGINE CO. 206 FDNY -DDC (Continued) **S106013243**

July through December 2007. The report stated that SVE system was constructed at the site in 2002 to remediate the existing soil contamination. In 2005 URS advanced six confirmation soil borings. In a letter dated April 5 2005, URS suggested the SVE system appeared to have reached asymptotic conditions and presented results of the confirmation soil sampling requesting termination of SVE system. Also, URS proposed groundwater monitoring. DEC approved these proposals. Roux performed semi-annual groundwater sampling of four wells in October 2007. No VOCs were detected that exceeded any NYSDEC AWQSGV. With the exception of the 27 ppb detection of acenaphthene in MW-04, no SVOCs were detected during the October 2007 sampling round. No VOCs were detected in MW-01 for three consecutive groundwater sampling rounds, and no SVOCs were detected in MW-01 for six sampling rounds. Roux recommended termination of the monitoring program and closing spill #0300635. DEC concurs with Roux findings. Spill #0300635 is closed. However, spill closure requests for the sites where soil contamination was encountered and treated should be accompanied by a soil plume map with the latest soil laboratory data. This map and the data were not included in the report. This information should be submitted to DEC within a month. Information regarding soil sampling performed near diesel and gasoline fill ports should be included in the report. If the above information is not submitted or the submitted information prove that the cleanup has not been completed DEC may reactivate this spill number. " AZ 7-14-2008 As per my request, Roux sent e-copy of the latest soil sampling report which was e-doc'ed. I contacted B. Morrissey. He will submit modified closure report (electronic version). AZ 4-17-2009 An e-mail sent to Roux/DDC: "Roux recommended that wells associated with the investigation of Spill#0300635 (which was closed) should be properly abandoned. This recommendation is approved. However, if some wells could be used for evaluation of spill #0012768, then these wells should remain open." AZ

Remarks: valve leaked to ground on fuel system. leak stopped. cleanup not started.

DER Facility ID:	323677
DEC Memo:	12/11/06-Hiralkumar Patel. received message from Matt (Cell: 631-767-9098) from Associated Environmental. spoke to John at Associated and asked him to DEC Rahman. 12/18/06 Rahman- Phase II(partial) Subsurface Investigation is prepared by Associated Environmental Services Ltd(Matthew Boeckel@631.234.4280).The site was utilized as a paving company and a oil company from at least 1807 to the late 1960s.Sanborn Fire Insurance Maps indicated the presence of large gasoline and fuel oil storage tanks.The site is currently utilized as warehouse and distribution purposes.During the Phase II investigation, soil/ground water samples were collected from the ground surface to a depth of 20' below grade.A majority of the site could not be investigated due to the presence of merchandise.Ground water flows to the west, towards English Kills.There was petroleum based odor and staining as well as elevated PID readings detected in the soil samples collected from borings B-1 through B-8. Ground water analytical results show presence of elevated levels of VOCs(MTBE- 33 ug/l,Naphthalene-6900 ug/l),SVOCs and RCRA metals.RP's consultant plans to conduct additional investigation after clearing the interior of the subject building that could not be accessed due to storage of merchandise. Spill case is transferred to Remediation section B for determination regarding further investigation/remedial work. 1/11/2007 - Vadim Brevdo spoke with Matt (Consultant) and agreed that Site Investigation Work Plan can be submitted to Vadim Brevdo's name. Vadim Brevdo 1/25/2007 - Vadim Brevdo spoke with Matt Boeckel of Associated Environmental Service, reviwed and approved remedial investigation work plan dated January 18, 2007. Approval letter is dated January 24. 02/16/07: This spill case transferred from V. Brevdo to J. Kolleeny. Tried calling Matt Boeckel of Associated

COMMERCIAL WAREHOUSE (Continued) **S108296225**

Environmental Services (631-234-4280), but he was out; spoke with John Schretzmayer, mentioned some deficiencies with reports submitted (Phase II Remedial Investigation report (2/7/07) and Interim Remedial Measure Work Plan (2/8/07)), including inaccurate boring labelling on site plan, lack of former tank locations depicted on site plan, and need for greater detail regarding remedial proposal of sodium persulfate injections, such as quantity of material to be injected and health and safety considerations. Also asked that electronic versions of each report be submitted. John said Matt will get back to me. - JK 02/23/07: After discussing deficiencies in Interim Remedial Measure Work Plan with Matt Boeckel of Assoc. Env'tal Svcs, and receiving several faxed revised versions, entitled Remedial Measure Work Plan (with site location figure, Sanborn map showing former tank locations, more detailed discussion of proposed sodium persulfate injections with health and safety considerations, added language about soil sampling during installation of permanent monitoring wells and surveying of wells to determine groundwater flow direction, analytical parameters changed to STARS list of petroleum-related VOCs and SVOCs), I sent approval letter (in eDocs) to 221 Realty Co., LLC of 500 Broadway, Brooklyn, NY 11211, attn: Alex Gross, with cc's to Ken Zucker of Beechwood Mountain, LLC and Matt of AES. Approval letter asked for additional permanent well near boring B-9, installation and sampling of permanent wells prior to chem. ox. injections to determine baseline GW conditions, and commented that if follow-up GW monitoring fails to show sodium persulfate effectiveness, alternative remedial approach must be developed. Also, sent email to Matt of AES asking for hard copy of finalized work plan report, and electronic copies of all site-related reports. - J. Kolleeny 08/07/2007: This spill case was transferred to A. Doronova. -AD 09/2007: Spoke to Matt Boeckel regarding implementation of the work plan. He said that they encountering constant refusal during soil borings, so they need to use different drilling equipment. AES plans to perform this work in a few weeks. Matt will call back with an update information. AD 01/09/2008: Call and spoke with Jon of AES regarding work plan status update. He promised to get back. AD 02/28/2008: Jon of AES called and asked if they may re-locate proposed monitoring wells due to technical difficulties (thick layer of concrete - 3ft and more). He also wants to meet with us at the site. Told him to send us a site diagram with new locations for the wells and said that site visit may be possible next week. Spoke with J. Kolleeny regarding wells installation on this site. Called and left a message to Jon of AES. Talked later with him regarding concrete specification, groundwater depth and if air rotary drilling was applied. Jon said that concrete is re-bar concrete; air rotary drilling could not be applied due to low clearance - 8' and groundwater depth from the basement floor is about 5' deep. The site visit was scheduled on Monday, March 3, 2008. AD 03/03/2008: Received a message from AES, left on Friday, February 29, 2008 at 5 PM, that they would like to re-schedule site visit. Called and spoke with Christina of AES. The site visit was cancelled for today. AD 03/05/2008: Scheduled new site visit for Friday March 7, 2008. AD 03/07/2008: Visited the site with J. Kolleeny. Met there with John Schretzmayer of AES. He showed the property and explained why some of the injection points could not be installed. The soil has some elevated levels of SVOC contamination, groundwater result indicates exeedances in VOC. We discussed the implementation of the proposed remedial action plan and agreed to reduce the numbers of proposed

COMMERCIAL WAREHOUSE (Continued) **S108296225**

injection point from 21 to 15 and add one more monitoring well. AD 08/07/2008: Called and left a message to J. Schretzmayer of AES regarding a summary report submission. AD 08/14/2008: Called and left a message to J. Schretzmayer of AES. AD 08/15/2008: Received a message from AES. The hard copy of the report will be submitted next week. AD 09/19/2008: Did not receive report. Spoke with a secretary of AES, left a message for J. Schretzmayer regarding the report submission. AD 10/14/2008: Called and left a message to J. Schretzmayer to call me back. AES email address is: <AssociatedEnv@aol.com>. AD 10/29/2008: Received the report. DL to eDocs. Will review. AD 11/03/2008: Reviewed the report. It states that a total of four monitoring wells were installed at the site. The analytical results for the April 2008 groundwater samples indicated that there were several VOCs and SVOCs at concentrations exceeding their NYSDEC standards (MTBE in MW-01 at 44 ppb). To remove dissolved phase contamination in the groundwater, AES used sodium persulfate solution (oxidizer) by introducing it via 14 injection wells at a depth of 10 to 15' bellow grade. October 2008 groundwater sampling event was scheduled to determine if the chemical oxidant solution has effectively reduced contaminant concentrations in the groundwater. A summary report will be provided to DEC following October 2008 monitoring event with conclusions and recommendations. AD 03/30/2009: Called to AES and left a message to a secretary for J. Shretzmayer regarding a QMR submission. AD 04/27/2009: Did not receive any response yet. Called and left a message to Mr. Shretzmayer. AD 05/08/2009: Received ecopy of the IRM - Groundwater Sampling Report from J. Shretzmayer of AES via e-mail. DL to eDocs. AD 05/11/2009: Received a hard copy of the report. Will review. AD 05/14/2009: Reviewed the report. It states that on February 9, 2009 AES sampled three out of four monitoring wells at the site. The most contaminated well MW-4 could not be located due to the debris and reorganization of the warehouse. Baseline GW sampling in April 2008 indicated several VOCs and SVOCs at concentrations exceeding their NYSDEC standards (MTBE in MW-01 at 44 ppb). February 2009 sampling results indicated lower levels of SVOCs and MTBE in well MW-1 and ND levels of VOCs and SVOCs in wells MW-2 and MW-3. Based on the analytical results of the GW sampling and due to the fact that the subject site is occupied and soil removal is not feasible, the consultant recommends no further actions for this site. Discussed the site with J. Kolleeny of DEC. Called and spoke with Christine Mazzarella of AES. Asked if the location of the well MW-4 could be found, they should sample it, if not - than they should try to collect groundwater grab sample in its vicinity. Ms. Mazzarella will get back to us with their response. AD 07/13/2009: Received an e-mail from C. Mazzarella of AES saying: "Hello Ainura Attached please find subject report for your review.? Please reference?Spill #06-09662. Please contact us with any questions or comments following your review of the attached. Thank you Christine Mazzarella Associated Environmental Services, Ltd. 25 Central Avenue Hauppauge, New York 11788 631 234 4280 tel 631 234 4297 fax" DL the report to eDocs. Will review. AD 07/21/2009: Reviewed the report. It states that on May 27, 2009 AES sampled one temporary well point in the vicinity of well MW-4, according to the DEC request. The most contaminated well MW-4 could not be located during previous sampling event, due to the debris and reorganization of the warehouse. May 2009 sampling results indicated low levels of SVOCs and MTBE and ND levels of VOCs in the area of well MW-4. Based on historical analytical results of the GW sampling

COMMERCIAL WAREHOUSE (Continued) **S108296225**

and due to the fact that the subject site is occupied and soil removal is not feasible, the consultant recommends no further actions for this site. Discussed the site with J. Kolleeny of DEC. Taking into consideration investigative and remedial activities performed at the site, clear decreasing trend of VOCs and SVOCs in GW, and current GW conditions, it was decided to approve NFA request for this site. AD 07/27/2009: Issued and sent NFA letter. DL to eDocs. Case closed. AD

Remarks: PHASE TWO CONDUCTED AT SITE: LAB RESULTS REVEALED ELEVATED CONATMINENTS IN SOIL AND GROUNDWATER ABOVE STATE LEVEL: SITE WAS HISTORIACALLY UTILIZED FROM EARLY 1900'S TO THE LATE 1960'S AS A ASPHALT PAVING COMPANY, AND OIL TERMINAL:

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "VOUGHT" 8/11/2003-Vought-File Review by Vought: Phase I ESA-UST Closure Report-Oct 1999-Closure of sixteen (550-gallon) gasoline and diesel USTs. Soil analyticals show concentrations up to 7150ppb ethylbenzene(TH3) and 788ppb MTBE(TH-10). Groundwater analyticals show concentrations up to 80ppb benzene(GP3), 293ppb ethylbenzene(GP3) and 167ppb MTBE(GP3). NYSDEC letter-11/5/99-Letter sent to Gaseteria requiring delineation of petroleum on and off-site before 12/10/99 and proper disposal of stockpiled contaminated soil stored on-site before 12/31/99. Letter to NYSDEC-12/22/99-Environmental Field Services-letter stating that Environmental Field Services has been retained by gaseteria for consulting services. EFS is reviewing data and will submit a complete remediation plan. Received disposal manifests from stockpiled soil on-Site. UST Closure Report-April 2002-Berninger Environmental (631-588-2251). Sixteen (550-gallon) gasoline USTs removed in 1999. Removal of two (6000-gallon) gasoline USTs and one (6000-gallon)

GASETERIA OIL CORP. (Continued) **S104649400**

diesel UST. No "significant" corrosion or holes were found in tanks. Groundwater exposed at bottom of excavation. Soil analyitcals show concentrations up to 19900ppb 1,2,4-trimethylbenzene, 2930ppb chrysene and 1850 benzo(a)anthracene. Groundwater analyticals show concentrations up to 24.5ppb benzene, 157ppb ethylbenzene, 368ppb xylene and 447ppb napthalene. Groundwater at a depth of 8' below grade. The English Kills are located 600 feet to the east. Baseline Acquisition Assessment Report-Oct 2002-Delta Environmental-PBS database indicates removal of fourteen (550-gallon) gasoline USTs and four (550-gallon) diesel USTs. Delta recommends installation of permanent monitoring wells. Six soil borings were performed, ten soil samples and four groundwater samples were analyzed. Surrounding area is "light industrial". School is 1500' west of site. Groundwater flow to the southeast and ranges from depths of 5' to 14" bgs. Soil boring analyticals show up to 433ppb benzene(SB6), 2100ppb toluene(SB5)and 11600ppb ethylbenzene(SB1) and 54100ppb napthalene(SB1). Groundwater analyticals show up to 8040ppb MTBE(SB5). 8/29/2003-Vought-NYSDEC sent letter requiring: 1)installation of borings/wells at former tank location, across Vandervoort Avenue and Grand Street and at boring location B-3 in Phase I-Report (see Oct 1999) 2)EPA Method 8260/8270 on groundwater samples and 3)well purging to continue until parameter stabilization. 12/30/2003-Vought-Spoke with Steve Muller and investigation plan will not arrive as per CAP schedule due to ongoing construction at site. Steve will wait until construction is complete until plan is submitted which will be by 2/2/03.
1/6/05-Vought-Reveiwed Subusurface Investigation Workplan (Applied Geosolutions) dated July 2004 and received on 7/28/04. North of the site is a deli, iron works and self storage. West of the site is a warehouse. South of the site is a junkyard and warehouse. East is a vacant lot and bar. Groundwater flow likely to the southeast. Between 10/03 and 1/04 2977.25 tons of soil were removed from the site during raze and rebuild activities. Proposal for the installation of five Geoprobe wells. "Wtihin 30 days from the approval of this Subsurface Investigation Work Plan Applied Geosolutions will begin performing Task 1-Groundwater Monitoring Well Installation". "Applied Geosolutions will prepare and submit a final report to Gaseteria and NYSDEC within 60 days after the completion of all work associated with the approved Work Plan...". Vought sent letter approving of workplan and requesting notification upon scheduling of an investigation date. 5/23/05-Vought-Reviewed Final Subsurface Investigation Report (ASR Muller) dated 3/25/05 and received on 3/25/05. "Based on the information presented in this report, AGS respectfully requests that no further subsurface investigation or remedial activities be performed at the subject site". Groundwater between 5-7' below grade and flow to the southeast. Installation of three monitoring wells. Groundwater analyticals show 2ppb benzene(MW1), 14ppb MTBE(MW1), 46ppb isopropylbenzene(MW1), 110ppb n-propylbenzene(MW1), 16ppb MTBE(MW2), 70ppb MTBE(MW3). DEC sent letter denying no further action and requiring wells be installed at locations on 1/6/05 Workplan. FILE TRANSFERRED FROM VOUGHT TO OBLIGADO 10/20/05- Obligado - Review Baseline aquisition Assessment Report prepared by Delta, submitted on 6/17/05. 1 550 gallon fuel oil tank was discovered during excavation for new tank field. Delta took one soil sample FO-1, only one SVOC exceedence for Chrysene at 1,220 ppb. Also 1.5 ppb cadmium and 8.8 ppb mercury. Also 4 samples collected from new tank field. No impacts detected. 11/3/05 - Obligado - Sent email to Tomasello asking when additional monitoring

GASETERIA OIL CORP. (Continued) **S104649400**

well will be installed. 11/14/05 - Obligado - Site visit with ASR tomasello. Agree to take one Geoprobe ground water sample downgradient from former tankfield. 1/6/05 - Obligado - Received call from S.Muller. They installed a geoprobe well at Grand Street downgradient of the tankfield and took a ground water sample and results showed ND for BTEX and 14 ppb for MTBE. Told him to send a NFA request inorder to close out spill. 1/17/05 - Obligado - Received closure request from ASR Steve Muller. Ground water results show: ND for BTEX in all 4 wells, max MTBE is 38 ppb in MW3. NFA granted based on non detect BTEX for 2 consecutive quarters, MTBE concentrations decreasing in MW3 from 70 ppb in 3/05, down to 38 in 12/05.

DEC Region:	2
DER Facility ID:	78016
DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was "ROMMEL" 4/12/04-Vought-Spill transferred from Tibbe to Rommel as per Rommel 12/29/05 Transferred to E. Hampston via Spill Initative. Called listed owner via PBS information (J. Brown 718-243-4581) no pickup, no voice mail. Will forward letter requesting information. 11/02/06 Reassigned to Sun.(JS/MS) 2/13/07: Original contact number on PBS is for former location (on Jay Street) of MTA facility. Contact made with representative at 646.252.5777. Rachel Kron who is in charge of MTA spills will get back to me (MS) upon obtaining associated documents. (JS/MS) 5/15/07: As per R. Kron, MTA meets with DEC monthly and this site will be brought up at next meeting. She will contact me with update after meeting. See M.Tibbe. (JS/MS) 8/2/07: DEC still has not heard from MTA. Will contact Mrs. Kron again and issue a letter if necessary. (JS/MS) 12/3/07: Site should be brought up at next MTE/DEC meeting. (JS/MS) 04-04-08: Transferred to Tibbe. 11/12/10 - spill re-assigned from Tibbe to Joe O'Connell
Remarks:	CONTAM SOIL DISCOVERED DURING EXCAVATION. WILL STOCKPILE, TEST, & DISPOSE.

DEC Region:	2
DER Facility ID:	358126
DEC Memo:	Sangesland spoke to ECO Nichols. He says a gas station was doing tank work and during his site inspection he saw 1 gal of antifreeze on the pavement.
Remarks:	Caller states a truck was leaking fluid onto the blacktop. Caller was also concerned about the vehicle selling fuel from the roadside. Speedy dry was put down by employees, some product did go into a storm drain.
