Executive Summary

Overview

A data assessment was performed by the AECOM Pittsburgh and Westford Chemistry Consulting Groups on nine data packages from H2M Labs, Inc., 575 Broad hollow Road, Melville, NY 11747 for the analysis of soil and groundwater samples collected on September 22, 2009 - December 16, 2009 at the Equity former MGP site.

The data were evaluated for conformance to method specifications and qualifiers were applied using the validation criteria set forth in the *USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Superfund Organic Methods Data Review*, USEPA-540-R-07-003, July 2008, with additional reference to *USEPA Contract Laboratory Program (CLP) National Functional Guidelines for Organic Data Review*, document number EPA 540/R-99-008, May 1999 and *USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review*, EPA-540-R-04-004, October 2004, as they apply to the analytical methods employed. Field duplicate RPD control limits were taken from the *USEPA Region I Laboratory Data Validation Functional Guidelines for Evaluating Organics Analyses,* February 1988, upheld in DRAFT 1993.

H2M processed the samples and reported the results under nine sample delivery groups (SDGs). Table 1 provides a sample submittal list. The following analytical methods were requested on the chain-of-custody (COC) records:

- Volatile Organic Compounds by USEPA SW-846 Method 8260B,
- Semivolatile Organic Compounds by USEPA SW-846 Method 8270C,
- Organochlorine Pesticides by USEPA SW846 Method 8081A,
- Polychlorinated Biphenyls (PCBs) as Aroclors by USEPA SW-846 Method 8082,
- Herbicides by USEPA SW-846 Method 8151A,
- Petroleum Fingerprint by USEPA SW-846 Method (modified) 8100 (by GC/MS),
- Trace Metals by USEPA SW-846 Methods 6010B, 7471A/7470A,
- Total and Free Cyanide by USEPA SW-846 Method 9010/9014, and
- Percent Moisture by ASTM Method D2216 (soils only) for dry weight corrections.

Summary

Data quality for the organic analyses was evaluated by reviewing the following parameters: holding times, GC/MS tuning and performance standards, internal standards, initial and continuing calibrations, surrogate recoveries, laboratory control standards (LCSs), laboratory blanks, laboratory and field duplicates, compound identification, and compound quantitation.

Inorganic data quality was evaluated by reviewing the following parameters: holding times, matrix spikes, initial calibrations, continuing calibration verification standard recoveries, contract required detection limit standard recoveries, laboratory control samples, ICP interference check sample recoveries, ICP serial dilution results, field and laboratory duplicates, and laboratory blanks.

Seventeen soil manganese results were rejected because of matrix interference indicated by a high matrix spike recovery. Five herbicide results were rejected because of matrix interference that caused dual GC column imprecision. One hundred and twelve volatile organic results were rejected because sample GW-1 and a trip blank had visible headspace. Sixteen semivolatile organic results were rejected because of matrix interference that caused internal standard recoveries to recover at less than 25%. All other data have been determined to be useable for the purpose of assessing the presence/absence and quantitative concentrations of the analytes in the media tested (i.e., soil and groundwater) with the qualifications described below. Several data points were qualified because of blank contamination, low method and/or instrument bias, matrix effects and/or sample heterogeneity, and method/field sampling imprecision. There were several instances of elevated reporting limits caused by the dilution required to bring the analyte concentrations into the calibration range and/or minimize matrix interferences. Completeness of 99.4% was achieved for this data set.

The data qualifier summaries are attached as Appendix B of this report. A glossary of data qualifier definitions is included in Appendix A of this report.

Each noncompliance with specific data usability criteria is discussed below. Support documentation for data qualifications was included in Appendix C of this report. Specific page references for the supporting documentation in the laboratory reports were provided in each item header.

1.0 Volatile Organic Compounds

AECOM049

a. Blank Contamination (pp. V437-V438, V472-V473): The common laboratory solvent methylene chloride was detected in the method blanks associated with the low-level soil (LLS) samples analyzed on 10/02/09 and 10/12/09 at concentrations greater than the quantitation limits. All soil samples within this SDG were affected. The positive methylene chloride results for the soil samples were qualified "U" as undetected, because of laboratory contamination.

   The common laboratory solvent acetone was detected in the trip blank TB-093009 and the equipment (rinsate) blank RB-100509 at concentrations estimated below the quantitation limit. The positive acetone results for samples SB-17 (1-2) and SB-7 (6-8) were greater than the quantitation limits and were qualified "J," as biased high, and the positive acetone results for samples SB-8 (2-3), SB-5 (16-18, and SB-5 (28-30) were estimated below the quantitation limits and were qualified "U," as undetected at the quantitation limits, because of laboratory contamination.

b. Calibrations (pp.V299-V300, V365-V367, V392-V393, V407, V420-V421): The continuing calibration percent differences (%Ds) for vinyl chloride and trichlorofluoromethane were greater than the quality control limit of 25% on 10/02/09 at 12:34 on instrument HP5972-2. Sensitivity decreased with respect to the initial calibration average relative response factors. The vinyl chloride and trichlorofluoromethane results for samples SS-2, SS-3, SS-4, SS-5, DUP-1, SB-3 (4-5), SB-17 (1-2), SB-5 (52-54), SB-5 (16-18), SB-5 (28-30), and SB-8 (2-3) were non-detect and were qualified "UJ," as estimates because of low instrument bias. No data qualifications were required for non-detect results in response to the %Ds that were greater than the quality control limit of 25% and sensitivity increased with respect to the initial calibration average relative response factors. The initial calibration relative standard deviation for acetone was greater than 30% on 09/24/09 on instrument HP5972-2. The positive result for acetone in sample SB-17 (1-2) was qualified "J," as an estimated concentration, because of calibration non-conformance.

   No data qualifications were required for non-detect results in response to the %Ds on 10/12/09 at 10:38 on instrument HP5972-2 that were greater than the quality control limit of 25% and sensitivity increased with respect to the initial calibration average relative response factors. The initial calibration relative standard deviations for acetone and methylene chloride were greater than 30% on 10/09/09 on instrument HP5972-2. The positive and non-detect results for acetone and methylene chloride in sample SB-7 (6-8) were qualified "J" and "UJ," as estimates, because of calibration non-conformance.

c. Matrix Spike Recoveries and RPDs (p.V6): Sample SB-3 (4-5) was designated in the field to be processed as the MS/MSD sample. The SB-3 (4-5) MS/MSD recoveries for 1,1-dichloroethene, and trichloroethene were less than the lower advisory limits. The 1,1-dichloroethene, and trichloroethene results for sample SB-3 (4-5) were non-detect and were qualified "UJ," as estimates, because of low bias attributable to matrix effects.

d. Dilutions and Reporting Limits (Form 1): Samples SB-5 (16-18) and SB-5 (28-30) required analysis at an initial ten-fold dilution and subsequent analysis using the medium-level methanol soil extraction (MLS) method to bring several target compound concentrations into the calibration range. The initial dilution elevated the quantitation limits and detection limits for these samples. The surrogate recoveries were acceptable. No data qualifications were required.

AECOM050

a. Blank Contamination (pp. V493, V499, V505, V516, V522): The common laboratory solvent methylene chloride was detected in the method blanks associated with the low-level soil (LLS) samples analyzed on 10/02/09, 10/06/09, 10/08/09, 10/12/09, and 10/13/09 at concentrations greater than the quantitation limit. All soil samples within this SDG were affected. The positive methylene chloride results for the soil samples were qualified "U" as undetected, because of laboratory contamination.

   The common laboratory solvent acetone was detected in the trip blank associated with the samples in this SDG and in the method blank associated with the samples analyzed on 10/06-07/09 at concentrations estimated below the quantitation limits. All soil samples within this SDG were affected. The positive acetone results estimated below the quantitation limits were qualified "U" as undetected at the quantitation limit, because of laboratory contamination.

b. Surrogate Recoveries (pp. V3-V6): The 4-bromofluorobenzene surrogate recovery for sample SB-9 (4-5) was greater than the upper quality control limit. The surrogate recovery did not improve upon reanalysis on a different day. The positive results of the initial analysis of sample SB-9 (4-5) were qualified "J," as estimated concentrations, because of high bias attributable to matrix effects.

   The 4-bromofluorobenzene surrogate recovery for sample SB-14 (1-2) was greater than the upper quality control limit. The surrogate recovery improved upon reanalysis at a dilution on a different day. The positive results of the initial (undiluted) analysis of sample SB-14 (1-2) were qualified "J," as estimated concentrations, because of high bias attributable to matrix effects.

   The 1,2-dichloroethane-d4 surrogate recovery for LLS sample SB-4 (1-2) was less than the lower quality control limit. The surrogate recoveries for the subsequent MLS analysis were within the quality control limits. The positive and non-detect LLS results for sample SB-4 (1-2) were qualified "J" and "UJ," as estimates, because of low bias attributable to matrix effects.

   The 1,2-dichloroethane-d4 and toluened-8 surrogate recoveries were less than the lower quality control limits and the 4-bromofluorobenzene surrogate recovery was greater than the upper quality control limit for LLS sample SB-13 (18-24). The 1,2-dichloroethane-d4 and 4-bromofluorobenzene surrogate recoveries for the subsequent MLS analysis were greater than the upper quality control limits. The positive and non-detect results for sample SB-13 (18-24) were qualified "J" and "UJ," as estimates, because of matrix effects.

   The 1,2-dichloroethane-d4 surrogate recoveries for LLS samples SB-10 (16-18) and SB-10 (40-41.5) were less than the lower quality control limit. The surrogate recoveries for the subsequent MLS analyses were within the quality control limits. The positive and non-detect LLS results for samples SB-10 (16-18) and SB-10 (40-41.5) were qualified "J" and "UJ," as estimates, because of low bias attributable to matrix effects.

c. Calibrations (pp.V337-V339, V385-V387, V433-V435, V439-V441, V445-447, V463-V465, V469-V471): The continuing calibration %Ds for vinyl chloride and trichlorofluoromethane were greater than the quality control limit of 25% on 10/02/09 at 12:34 on instrument HP5972-2. Sensitivity decreased with respect to the initial calibration average relative response factors. The vinyl chloride and trichlorofluoromethane results for samples SB-15 (3-4), SB-16 (2-3), and SB-18 (4-5) were non-detect and were qualified "UJ," as estimates because of low instrument bias. No data qualifications were required for non-detect results in response to the %Ds that were greater than the quality control limit of 25%, except for 2-butanone. Sensitivity increased with respect to the initial calibration average relative response factors and the 2-butanone results for samples SB-15 (3-4), SB-16 (2-3), and SB-18 (4-5) were qualified "J," as estimated concentrations, because of high instrument bias. The initial calibration relative standard deviation for acetone was greater than 30% on 09/24/09 on instrument

HP5972-2. The positive results for acetone in sample SB-15 (3-4), SB-16 (2-3), and SB-18 (4-5) were qualified "J," as estimated concentrations, because of calibration non-conformance.

The continuing calibration %Ds for chloromethane, dichlorodifluoromethande, vinyl chloride, chloroethane, trichlorofluoromethane, cyclohexane, methylcyclohexane, isopropylbenzene, and 1,2,4-trichlorobenzene were greater than the quality control limit of 25% on 10/06/09 at 22:18 on instrument HP5972-2. Sensitivity decreased with respect to the initial calibration average relative response factors. The positive and non-detect chloromethane, dichlorodifluoromethande, vinyl chloride, chloroethane, trichlorofluoromethane, cyclohexane, methylcyclohexane, isopropylbenzene, and 1,2,4-trichlorobenzene results for associated samples SB-9 (4-5), SB-9 (20-21.5), SB-9 (36-38), SB-9 (40-42), SB-10 (3-4), SB-10(48-50), SB-13 (18-24), SB-14(1-2), SB-14B (11-13), SB-4 (1-2), SB-10 (16-18), SB-10 (40-41.5), and SB-12 (4-5) were qualified "J" and "UJ," as estimates, because of low instrument bias. The initial calibration relative standard deviation for acetone and methylcyclohexane were greater than 30% on 09/24/09 on instrument HP5972-2. The positive results for acetone and methylcyclohexane in samples SB-9 (4-5), SB-9 (20-21.5), SB-9 (40-42), SB-10 (3-4), SB-13 (18-24), SB-14(1-2), SB-4 (1-2), SB-10 (16-18), and SB-10 (40-41.5) were qualified "J," as estimated concentrations, because of calibration non-conformance.

The continuing calibration %D for bromomethane was greater than the quality control limit of 25% on 10/12/09 at 10:38 on instrument HP5972-2. Sensitivity decreased with respect to the initial calibration average relative response factor. The non-detect bromomethane results for associated samples TP(7.0) and DUP-2 were qualified "UJ," as estimates, because of low instrument bias. The continuing calibration %Ds for methylcyclohexane and 1,2,4-trichlorobenzene were greater than the quality control limit of 25% on 10/12/09 at 10:38 on instrument HP5972-2. Sensitivity increased with respect to the initial calibration average relative response factors. Methylcyclohexane and 1,2,4-trichlorobenzene were not detected in associated samples TP(7.0) and DUP-2. No data qualifications were required in response to the high instrument bias.

The continuing calibration %Ds for chloromethane and bromomethane were greater than the quality control limit of 25% on 10/13/09 at 10:45 on instrument HP5972-2. Sensitivity increased with respect to the initial calibration average relative response factors. Chloromethane and bromomethane were not detected in associated sample TP(7.5). No data qualifications were required in response to the high instrument bias. The continuing calibration %D for methylene chloride was greater than the quality control limit of 25% on 10/13/09 at 10:45 on instrument HP5972-2. Sensitivity decreased with respect to the initial calibration average relative response factor. The non-detect methylene chloride result for associated sample TP(7.5) was qualified "UJ," as an estimate, because of low instrument bias.

d. Matrix Spike Recoveries and RPDs (p.V7): Sample TP-3 (7.5) was designated in the field to be processed as the MS/MSD sample. The RPD between the TP-3 (7.5) MS/MSD recoveries for 1,1-dichloroethene was greater than the maximum advisory limit. The 1,1-dichloroethene result for sample TP-3 (7.5) was non-detect and was qualified "UJ," as an estimate, because of imprecision attributable to matrix effects.

e. Dilutions and Reporting Limits (Form 1): Samples SB-9 (20-21.5), SB-13 (18-24), and SB-4 (1-2) required analysis using the MLS method to bring several target compound concentrations into the calibration range.

Samples SB-9 (36-38) and SB-14B (11-13) required analysis at an initial LLS dilution analysis to bring one or more target compound concentrations into the calibration range. The initial dilution elevated the quantitation limits and detection limits for these samples.

Samples SB-10 (16-18) and SB-10 (40-41.5) required analysis at an initial LLS dilution analysis and analysis using the MLS method to bring one or more target compound concentrations into the

a. Sample Preservation (p. A14): Sample GW-1 contained small headspace bubbles (3 mm-4 mm in diameter) in both VOA vials. The positive volatile results in sample GW-1 were qualified were qualified "J" as estimated concentrations, because of low bias attributable to improper preservation. The nondetect volatile results in sample GW-1 were qualified "R" and are not usable for data quality objectives.

b. Blank Contamination (pp. V43, V90, V98): Carbon disulfide was detected in the method blank associated with the undiluted analysis of sample GW-1 (analyzed 10/2/09) at a concentration less than the quantitation limit. The positive estimated below the quantiton limit carbon disulfide result in sample GW-1 was qualified "U" as undetected at the quantitation limit, because of laboratory contamination.

   1,2,4-Trichlorobenzene was detected in the trip blank associated with GW-1 at a concentration estimated below the quantitation limit. The positive 1,2,4-trichlorobenzene result estimated below the quantitation limit in sample GW-1 was qualified "U" as undetected at the quantitation limit, because of field blank contamination.

c. Surrogate Recoveries (pp. V3): The 4-bromofluorobenzene surrogate recovery for the undiluted analysis of sample GW-1 was greater than the upper quality control limit. The surrogate recoveries for the subsequent 100-fold dilution analysis were within the quality control limits. The positive undiluted results for sample GW-1 were qualified "J" as estimated concentrations, because of high bias attributable to matrix effects.

d. Calibrations (pp. V74-75, V80-81): The continuing calibration %Ds for 4-methyl-2-pentanone, 2-hexanone, 1,1,2,2-tetrachloroethane, methylcyclohexane, and 1,2-dibromo-3-chloropropane were greater than the quality control limit of 25% on 10/02/09 at 14:17 on instrument HP5973I. Sensitivity increased with respect to the initial calibration average relative response factors. The positive 2-methyl-2-pentanone result for sample GW-1 was qualified "J," as an estimated concentration, because of high instrument bias. All other associated results were non-detect and did not require qualification in response to the high instrument bias.

   The continuing calibration %Ds for 1,1,2-trichloro-1,2,2-trifluoroethane, cyclohexane, 1,1,2,2,-tetrachlorethane, methylcyclohexane, and isopropylbenzene were greater than the quality control limit of 25% on 10/08/09 at 06:33 on instrument HP5973I. Sensitivity increased with respect to the initial calibration average relative response factors. All associated results were either non-detect (TB-092809 and SB-092809) or not reported (GW-1 dilution analysis) and did not require qualification in response to the high instrument bias.

e. Dilutions and Reporting Limits (Form 1): Sample GW-1 required analysis at a secondary dilution to bring several target compound concentrations into the calibration range. The benzene, toluene, ethylbenzene, styrene, m&p-xylene, and o-xylene results were reported from this 100-fold dilution analysis. It should be noted that the styrene result was diluted to a level less than the lower calibration standard. The validator chose to report the dilution result because the undiluted concentration exceeded the calibration range by a factor of 3. This styrene concentration was qualified "J," as an estimated concentration, because the concentration was outside the calibration range. No further data qualifications were required.

d. Dilutions and Reporting Limits (Form 1): Sample SB-13 (12-14) required analysis at an initial LLS dilution and required subsequent analysis using the MLS method to bring several target compound concentrations into the calibration range. Isopropylbenzene was diluted out in the MLS analysis. The original isopropylbenzene result was reported and qualified "J," as an estimated concentration, because the calibration range was exceeded. Field ID	Lab ID	Analyte	Original Results Over-range (µg/Kg)	Lab Qualifier	Dilution Factor	Reportable Results	Validation Qualifier
SB-13(12-14)	0910783-002	Isopropylbenzene	3600	E	10	3600	J

a. Sample Preservation (pp. A4, A19): Trip blank sample TB100909 contained small headspace bubbles (6 mm-7 mm in diameter) in both VOA vials. The positive volatile results in sample TB100909 were qualified were qualified "J" as estimated concentrations, because of low bias attributable to improper preservation. The nondetect volatile results in sample TB100909 were qualified "R" and are not usable for data quality objectives. Also note that per the chain-of-custody, the sampling date for sample TB100909 was listed as September 28, 2009, thus the 14-day holding time was exceeded by 3 days. This collection date is most likely inaccurate because all samples on the same COC were collected October 7-8, 2009. No validation actions were required since all VOC results in sample TB100909 were either estimated or rejected for headspace bubbles.

b. Blank Contamination (pp. V358, V367, V376, V381, V386): The common laboratory solvent methylene chloride was detected in the method blanks associated with the LLS samples analyzed on 10/14/09, 10/23/09, 10/30/09, and 11/11/09 at concentrations greater than the quantitation limits. All soil samples within this SDG were affected. The positive methylene chloride results for all soil samples were qualified "U" as undetected, because of laboratory contamination.

   The common laboratory solvent acetone was detected in trip blank sample TB100909 and the method blanks associated with the LLS samples analyzed on 10/23/09 and 11/11/09 at concentrations estimated below the quantitation limits. The positive acetone result for samples SB-4 (36-38), SB-4 (44-46), TP-1 (12), SB-2B (14-16), SB-2B (37-38), SB-2B (42-44), SB-14B (38-40), SB-16B (44-46), SB-6 (26-28), SB-6 (30-32), SB-12B (40-42), and SB-12B (48-50) were greater than the reporting limits and were qualified "J," as estimated concentrations, because of high bias attributable to field/laboratory contamination.

   The common laboratory solvent methylene chloride and 2-butanone were detected in the method blank associated with the MLS samples analyzed on 10/26/09 at concentrations less than the quantitation limits. The continuing calibration %Ds for methylene chloride and toluene were greater than the quality control limit of 25% on 10/14/09 at 13:57 on instrument HP5972-2. Sensitivity decreased with respect to the initial calibration average relative response factors. Note: The 10/09/09 initial calibration RSD for methylene chloride was greater than 30%. The surrogate recoveries for the subsequent MLS analysis were within the quality control limits. The positive results of the initial analysis of sample SB-17 (16-18) were reported with all positive results qualified "J," as estimated concentrations, because of high bias attributable to matrix effects.

   The continuing calibration %D for methylene chloride was greater than the quality control limit of 25% on 10/23/09 at 16:37 on instrument HP5972-2. Sensitivity decreased with respect to the initial calibration average relative response factor. Note: The 10/09/09 initial calibration RSD for methylene chloride was greater than 30%. The positive methylene chloride results for associated samples SB-3 (46-48), SB-3 (36-38), and SB-8 (24-26) were qualified "J," as estimates, because of low instrument bias.

   The continuing calibration %D for bromoform was greater than the quality control limit of 25% on 10/09/09 at 16:37 on instrument HP5972-2. Sensitivity increased with respect to the initial calibration average relative response factor. The positive methylene chloride results for associated samples SB-17 (40-42), SB-7 (38-40), and SB-7 (44-46) were qualified "J," as estimates, because of low instrument bias.

The continuing calibration %D for dichlorodifluoromethane was greater than the quality control limit of 25% on 11/11/09 at 11:31 on instrument HP5971. Dilutions and Reporting Limits (Form 1): Samples SB-17 (16-18) and SB-17 (36-38) required analysis at an initial 5x dilution and required further required analysis using the MLS method to bring several target compound concentrations into the calibration range and/or minimize matrix interference. The validator chose to report the m&p-xylene result for sample SB-17 (16-18) from the MLS analysis even though it did not exceed the calibration range in the initial 5x dilution since there may have been some matrix interference in the initial analysis. No data qualifications were required.

Samples SB-3 (36-38) and SB-8 (24-26) required analysis at an initial 10-fold dilution and required further analysis using the MLS method to bring several target compound concentrations into the calibration range and/or minimize matrix interference. The MLS analysis for samples SB-3 (36-38) and SB-8 (24-26) were further diluted 50-fold. The initial ten-fold dilution elevated the detection and reporting limits. The isopropylbenzene result in sample SB-8 (24-26) was greater than the calibration range in the 10-fold dilution analysis but was diluted to a level less than the lower calibration standard in the MLS analysis. The MLS analysis result was reported and was qualified "J," as an estimated concentration because the concentration was less than the lowest calibration standard. The isopropylbenzene result in sample SB-3 (36-38) was diluted out in the MLS analysis. The original isopropylbenzene result was reported and qualified "J," as an estimated concentration, because the calibration range was exceeded. The details are provided in the table below.

Field ID	Lab ID	Analyte	Original Results (Over-range) (µg/Kg)	Lab Qualifier	Dilution Factor	Reportable Results (µg/Kg)	Validation Qualifier
SB-3 (36-38)	0911469-001	Isopropylbenzene	2,300	E	10	2,300	J

Samples SB-9(36-38), SB-13(18-24), SB-4(1-2), and SB-12(4-5) required analysis at a secondary dilution to bring one or more target compound concentrations into the calibration range. One or more compounds were diluted to levels less than the lower calibration standard. The higher of the two concentrations was reported and was qualified "J," as an estimated concentration, because the concentration was outside the calibration range.

Samples SB-16(2-3) SB-18(4-5), SB-9(4-5), SB-10(3-4), and DUP-2 required analysis at a secondary dilution to bring several target compound concentrations into the calibration range. The surrogate recoveries were within the quality control limits. No data qualifications were required.

Sample SB-13(18-24) was analyzed at an initial ten-fold dilution because of the high target analyte concentrations. The initial dilution elevated the detection limits and the reporting limits.

b. Calibrations (p.B47): The initial calibration relative standard deviation for 2-4-dinitrophenol was greater than 30% on 10/01/09 on instrument HP5973N. No data qualification was required since the 2,4-dinitrophenol in sample GW-1 was non-detect.

c. Dilutions (Form 1s): GW-1 was analyzed at a secondary dilution to bring one or more target compound concentrations into the calibration range. The concentrations originally exceeded the calibration range and were diluted out in the subsequent dilution analysis. The original results were reported and qualified "J," as estimated concentrations, because the calibration range was exceeded. The details are provided in the table below.

Field ID	Lab ID	Analyte	Original Results (Over-range) (µg/Kg)	Lab Qualifier	Dilution Factor	Reportable Results (µg/Kg)	Validation Qualifier

a. Blank Contamination (pp. B455-B456): Di-n-butyl phthalate was detected in the method blank MB-33167 extracted on 10/07/09 at a concentration estimated below the quantitation limit. Based on professional judgment, all samples within this SDG were evaluated for di-n-butyl phthalate contamination because they were all extracted using the same method. The positive di-n-butyl phthalate result for the soil sample TP-1 (9) was qualified "U" as undetected at the quantitation limit, because of laboratory contamination.

b. Internal Standard Area Counts (pp. B30-B32, B36): The chrysene-d12 and perylene-d12 internal standard recoveries for the initial (i.e., undiluted) analysis of samples SB-15(12-14) and SB-15(38-40) were less than the lower quality control limit. The positive and non-detect target compound results (di-n-octylphthalate through benzo(g,h,i)perylene) quantitated using the perylene-d12 internal standards were qualified "J" and "R," as estimates and rejected, because the internal standard recovery was less than 25%, indicating poor instrument stability attributable to matrix effects.

The recoveries for chrysene-d12 and perylene-d12 were less than 25%. The positive and non-detect TP-1(9) results: nitrobenzene through 4-chloro-3-methylphenol that were quantitated using the nonconforming internal standards were non-detect and were qualified "UJ," as estimates, because of instrument instability attributable to matrix interference. The positive and non-detect target compound results (pyrene through benzo(g,h,i)perylene) quantitated using the chrysene-d12 and perylene-d12 internal

The perylene-d12 internal standard recovery for the initial (i.e., undiluted) analysis of sample SB-2B(5) was less than the lower quality control limit, but greater than 25%. The positive and non-detect SB-2B(5) results for di-n-octylphthalate, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene were qualified "J" and "UJ," as estimates, because of instrument instability attributable to matrix interference.

c. Laboratory Control Sample Recoveries (pp. B7-B16): All LCS benzaldehyde recoveries were less than the lower quality control limit, but greater than 10%. d. Calibrations (pp.B375, B402, B411, B419, B428,B436): All continuing calibration %Ds for benzaldehyde were greater than the quality control limit of 25% on instrument HP5973N. Sensitivity decreased with respect to the initial calibration average relative response factor. The positive and non-detect benzaldehyde results for all associated soil samples were qualified "J" and "UJ," as estimates, because of low instrument bias.

The continuing calibration %Ds for isophorone were greater than the quality control limit of 25% on 10/13/09 at 17:33 and 10/19/09 at 14:33 on instrument HP5973N. Sensitivity increased with respect to the initial calibration average relative response factor. Isophorone was not detected in any of the associated samples. No data qualifications were required.

Calibrations (pp. B418, B456, B465, B475, B486-B487, B495): The continuing calibration %Ds for benzaldehyde and hexachlorocyclopentadiene were greater than the quality control limit of 25% on 10/28/09 at 12:38, 11/04/09 at 15:31, 11/05/09 at 22:14, and 11/09/09 at 17:17 on instrument HP5972. Sensitivity decreased with respect to the initial calibration average relative response factors. All samples were affected. All benzaldehyde and hexachlorocyclopentadiene results were non-detect and were qualified "UJ," as estimates, because of low instrument bias.

The continuing calibration %Ds for phenol, bis(2-chloroethyl)ether, 2,4-dinitrophenol, and 4,6-dinitro-2-methylphenol were greater than the quality control limit of 25% on 11/05/09 at 22:14 on instrument HP5972. Sensitivity decreased with respect to the initial calibration average relative response factors. The positive and non-detect phenol, bis(2-chloroethyl)ether, 2,4-dinitrophenol, and 4,6-dinitro-2-methylphenol results for associated samples SB-7(38-40) and SB-7(44-46) were qualified "J" and "UJ," as estimates, because of low instrument bias.

e. Surrogate Recoveries (p. B3): The phenol-d5 surrogate recoveries for samples SB-7(38-40) and SB-7(44-46) were greater than the upper quality control limit. The *National Functional Guidelines* permit one surrogate from each fraction (i.e., acid or base/neutral) to be nonconforming so long as the recovery is greater than 10%. No data qualifications were required.

The nitrobenzene-d5, 2-fluorobiphenyl, and 4-terphenyl-d14 surrogate recoveries for sample SB-3(36-38) were greater than the upper quality control limits for the undiluted analysis. The surrogates were diluted out in the reanalysis at a secondary dilution. All positive base/neutral compound results were qualified "J," as estimated concentrations, because of high bias attributable to matrix interference.

The 2-fluorobiphenyl and 4-terphenyl-d14 surrogate recoveries for sample SB-8(24-26) were greater than the upper quality control limits for the undiluted analysis. The surrogates were diluted out in the reanalysis at a secondary dilution. All positive base/neutral compound results were qualified "J," as estimated concentrations, because of high bias attributable to matrix interference.

f. Dilutions (Form 1s): Samples SB-3(36-38), SB-8(24-26), and SB-17(36-38) were analyzed at a secondary dilution to bring several target compound concentrations into the calibration range and/or minimize matrix interference. In cases where the concentration for one or more target compounds originally exceeded the calibration range and were diluted out in the subsequent dilution analysis. The original results were then reported and qualified "J," as an estimated concentration, because the calibration range was exceeded. The details are provided in the table below.

Field ID	Lab ID	Analyte	Original Results (Over-range) (µg/Kg)	Lab Qualifier	Dilution Factor	Reportable Results (µg/Kg)	Validation Qualifier

SB-17(36-38)	0911584-002	Benzo(b)fluoranthene	8200	E	1	8200	J

Sample SB-3(36-38), SB-8(24-26), and SB-17(16-18) required analysis at an initial and subsequent dilution to bring the target compound concentrations into the calibration range and/or minimize matrix interference. The initial dilution elevated the quantitation limits.

a. Surrogate Recoveries (p. B3): The nitrobenzene-d_5 surrogate recovery for sample SB-1C (80-81.5) was greater than the upper quality control limit. The *National Functional Guidelines* permit one

surrogate from each fraction (i.e., acid or base/neutral) to be nonconforming so long as the recovery is greater than 10%. No data qualifications were required.

b. Matrix Spike Recoveries and RPDs (p. B4): Sample SB-1C (23-25) was designated in the field to be processed as the MS/MSD sample. The pentachlorophenol recovery was greater than the upper advisory limit. Pentachlorophenol was not detected in sample SB-1C (23-25). No data qualification was required in response to the high bias.

c. Calibrations (p. B92, B151): The initial calibration relative standard deviation for benzaldehyde was greater than 30% on 11/23/09 on instrument HP5972. No data qualification was required because the benzaldehyde results for all soil samples in the SDG were non-detect.

The continuing calibration %D for 2,4-dinitrophenol was greater than the quality control limit of 25% on 12/03/09 at 11:01 on instrument HP5972. Sensitivity decreased with respect to the initial calibration average relative response factor. The 2,4-dinitrophenol results for associated samples SB-1C (23-25), SB-1C (80-81.5), SB-1C DUP01 (112009), and SB-1C (98-100) were non-detect and were qualified "UJ," as estimates, because of low instrument bias.

d. Dilutions (Form 1s): Samples SB-1C (80-81.5) and SB-1C DUP01 (112009) required analysis at an initial 10-fold dilution and required further dilution at 100-fold to bring several target compound concentrations into the calibration range and/or minimize matrix interference. The initial ten-fold dilution elevated the detection and reporting limits.

The positive 9-octadecanamide, (Z)- and eracylamide results for samples MW1A121409, MW1B121409, and MW1C121409 were qualified "U" as undetected at the reported concentration, because of laboratory contamination. benzaldehyde, N-nitroso-d-n-propylamine, nitrobenzene, isophorone, hexachlorocyclopentadiene, and 2-nitroaniline results were not reported from the dilution analysis of sample MW3C121509.

The continuing calibration %D for hexachlorobutadiene was greater than the quality control limit of 25% on 12/22/09 at 10:59 on instrument HP5972. d. Surrogate Recoveries (p. B3): The nitrobenzene-d_5 surrogate recovery for sample MW3C121509 and the 2-chlorophenol-d_4 and 1,2-dichlorobenzene-d_4 recoveries for sample MW4A121609 were greater than the upper quality control limit. No data qualifications were required.

e. Tentatively Identified Compounds (TICs) (Form Is): In some instances, TICs were computed against internal standards with a large interference. The laboratory manually re-calculated these TICs with the nearest internal standard without interference. If the TIC was reported from the dilution, the undiluted analysis was not recalculated but was reported with a "Y" qualifier for low bias. In these instances, the dilution result was reported. The affected TICs include 1-methylnaphthalene in sample MW1C121409 and all TICs in sample MW4A121609.

f. Dilutions (Form 1s): MW1C121409 and MW3C121509 were analyzed at a secondary dilution to bring one or more target compound concentrations into the calibration range. The 2-methylnaphthalene result in sample MW3C121509 was greater than the calibration range in the undiluted analysis but was diluted to a level less than the lower calibration standard in the 50-fold dilution analysis. The 50-fold dilution analysis was reported and was qualified "J," as an estimated concentration, because the concentration was less than the lowest calibration standard.

Sample MW4A121609 required analysis at an initial 10-fold dilution and required further dilution at 1000-fold to bring several target compound concentrations into the calibration range and/or minimize

matrix interference. The initial ten-fold dilution elevated the detection and reporting limits. The 2-methylphenol and 2,4-dimethylphenol results in sample MW4A121609 were greater than the calibration range in the 10-fold dilution analysis but were diluted to a level less than the lower calibration standard in the 1000-fold dilution analysis. The 1000-fold dilution analysis results were reported and were qualified "J," as estimated concentrations, because the concentrations were less than the lowest calibration standard.

B28): The naphthalene-d8 internal standard recoveries for the initial (i.e., undiluted) analysis of samples MW5B121609 and PW1121609 were less than the lower quality control limit, but greater than 25%. The positive and non-detect MW5B121609 and PW1121609 results: nitrobenzene through 2-methylnaphthalene, that were quantitated using the nonconforming internal standards were non-detect and were qualified "UJ," as estimates, because of instrument instability attributable to matrix interference.

b. Laboratory Control Sample Recoveries (pp. B7-B16): The LCS (LFB-34277) recovery for benzaldehyde was greater than the upper quality control limit. All other associated benzaldehyde, 2,4-dinitrophenol, and 4,6-dinitro-2-methylphenol were non-detect. No data qualifications were required in response to the high method bias. The LCS (LFB-34371) recoveries for caprolactam and 3/4-methylphenol were less than the lower quality control limits. Sensitivity decreased with respect to the initial calibration average relative response factors. The non-detect benzaldehyde and hexachlorocyclopentadiene results for associated sample MW6B121409 were qualified "UJ," as estimates, because of low instrument bias.

   The continuing calibration %Ds for benzaldehyde, N-nitroso-d-n-propylamine, isophorone, hexachlorocyclopentadiene, and 2-nitroaniline were greater than the quality control limit of 25% on 12/21/09 at 17:55 on instrument HP5972. Sensitivity increased with respect to the initial calibration average relative response factor. Hexachlorobutadiene was not detected in the associated samples. No data qualifications were required in response to the high instrument bias.

The continuing calibration %Ds for benzaldehyde, N-nitroso-d-n-propylamine, nitrobenzene, isophorone, hexachlorocyclopentadiene, and 2-nitroaniline were greater than the quality control limit of 25% on 12/22/09 at 10:59 on instrument HP5972. Sensitivity decreased with respect to the initial calibration average relative response factors. The positive and non-detect benzaldehyde, N-nitroso-d-n-propylamine, nitrobenzene, isophorone, hexachlorocyclopentadiene, and 2-nitroaniline results for associated samples MW2A121609, MW2B121609, MW5A121609, MW5B121609, and PW1121609 were qualified "J" and "UJ," as estimates, because of low instrument bias. The continuing calibration %D for hexachlorobutadiene was greater than the quality control limit of 25% on 12/22/09 at 10:59 on instrument HP5972. Sensitivity increased with respect to the initial calibration average relative response factor. Hexachlorobutadiene was not detected in the associated samples. No data qualifications were required in response to the high instrument bias.

g. Surrogate Recoveries (p. B3): The nitrobenzene-d5 surrogate recoveries for samples MW4C121509, MW4C121509D, MW5B121609, MW7B121509, and PW1121609 were greater than the upper quality control limit. Dilutions (Form 1s): MW4B121509, MW4C121509, MW4C121509, MW7B121509, MW2B121609, MW5A121609, MW5B121609, and PW1121609 were analyzed at a secondary dilution to bring one or more target compound concentrations into the calibration range. Where the concentrations originally exceeded the calibration range and were diluted out in the subsequent dilution analysis, the original results were reported and qualified "J," as estimated concentrations, because the calibration range was exceeded. Where the concentrations were diluted to levels less than the lower calibration standard, the higher of the two concentrations was reported and qualified "J," as an estimated concentration, because the concentration was outside the calibration range.

a. Surrogate Recoveries (pp. PE3-PE4): The decachlorobiphenyl surrogate recoveries exceeded the upper acceptance limit of 150% on both columns for all samples except SB-5(52-54), which yielded compliant recoveries on both columns, and SB-5(16-18), which yielded a compliant result on column 2. In addition, the tetrachloro-m-xylene surrogate recovery exceeded the upper quality control limit on column 1 for sample SB-7(6-8), and fell below the lower quality control limit on column 2 for the diluted analysis of sample SB-17(1-2). Therefore, the positive results for all samples except SB-5(52-54) were qualified "J," as estimated concentrations, because of high bias attributable to matrix effects. Non-detect results were not qualified on this basis.

b. Dilutions (Form 1s): Samples SS-4, SB-17(1-2), SB-5(16-18), and SB-5(28-30) were analyzed at secondary dilutions to bring one or more target compounds into the calibration range. No data qualifications were required on this basis. Results from the two runs were combined to ensure that all reported results were within the calibration. In most cases, non-detect results and results that fell within the calibration range were reported from the least diluted run. However, in some cases, the interferences present in the undiluted run were so significant that it was determined that the diluted result was more appropriate. These decisions were based on visual examination of the chromatograms and evaluation of dual column relative percent differences (RPDs).

c. Interferences (Form 1s): All samples exhibited severe matrix interferences, often attributable to the presence of one or more Aroclors. While no data were qualified on this basis, the interferences are likely responsible for the great number of surrogate nonconformances and the dual column precision nonconformances discussed below. In cases where samples were analyzed at multiple dilutions, the level of interferences present was a significant factor in the determination of which result to report.

d. Dual Column RPDs (pp. PE276-PE297): The dual column RPD exceeded the 40% criteria in several samples. Sample results less than the sample quantitation limit (SQL) with RPDs greater than 40%, but less than or equal to 50%, were qualified "J," as estimated; and results with RPDs greater than 50%, were qualified "U," as not detected at the sample quantitation limit. The results tabulated below were qualified using these criteria.

Results greater than or equal to the SQL with RPDs greater than 40%, but less than or equal to 70%, were qualified "J," as estimated; and results with RPDs greater than 70% were qualified "NJ,", as presumptively present at an estimated concentration. Note that Region 2 guidance states that in the absence of interference, results with RPDs greater than 100% should be rejected (qualified "R"). However, since interference was observed in all samples, no pesticide data were rejected on this basis. See attached nonconformances and Form 1s for specific details.

a. Surrogate Recoveries (p. PE3): The decachlorobiphenyl surrogate recoveries exceeded the upper quality control limit of 150% on both columns for samples SB-17(16-18) and SB-17(36-38). Therefore, all positive results for these two samples were qualified "J," as estimated concentrations, because of high bias attributable to matrix effects. Note that since the surrogates were diluted out of the diluted analysis, professional judgment was used to qualify the positive results reported from the diluted run as well. Non-detect results were not qualified on this basis.

b. Dilutions (Form 1s): Samples SB-3(36-38), SB-8(24-26), and SB-17(16-18) were analyzed at secondary dilutions to bring one or more target compounds into the calibration range. No data qualifications were required on this basis. SB-3(36-38) and SB-8(24-26) were not analyzed undiluted, resulting in elevated reporting limits for non-detect compounds. Sample SB-17(16-18) was analyzed diluted and undiluted; results from the two runs were combined to ensure that all reported results were within the calibration. In most cases, non-detect results and results that fell within the calibration range were reported from the least diluted run. However, methoxychlor was reported from the diluted run because the interferences present in the undiluted run were so significant that it was determined that the diluted result was more appropriate. This decision was based on visual examination of the chromatograms and evaluation of dual column relative percent differences (RPDs).

c. Dual Column RPDs (pp. PE181-PE186): The dual column RPD exceeded the 40% criteria in several samples. Sample results less than the sample quantitation limit (SQL) with RPDs greater than 40%, but less than or equal to 50%, were qualified "J," as estimated; and results with RPDs greater than 50%, were qualified "U," as not detected at the sample quantitation limit. The results tabulated below were qualified using these criteria.

Results greater than or equal to the SQL with RPDs greater than 40%, but less than or equal to 70%, were qualified "J," as estimated; and results with RPDs greater than 70% were qualified "NJ,", as presumptively present at an estimated concentration. Note that Region 2 guidance states that in the absence of interference, results with RPDs greater than 100% should be rejected (qualified "R"). However, since interference was observed in all samples, no pesticide data were rejected on this basis. See attached nonconformances and Form 1s for specific details.

a. Surrogate Recoveries (p. PE3): The tetrachloro-m-xylene surrogated recoveries exceeded the upper quality control limit of 150% on column 1 in samples MW4A121609 and MW4A121609D; and the decachlorobiphenyl surrogate recovery exceeded the upper quality control limit of 150% on column 1 for sample MW4A121609D. Therefore, positive results reported from column 1 for these two samples were qualified "J," as estimated concentrations, because of high bias attributable to matrix effects. Non-detect results were not qualified on this basis.

b. Laboratory Control Sample Recovery (p. PE9): The recovery of endrin (43%) fell below the lower quality control limit of 56% in the LCS analyzed 12/29/09. All positive and non-detect endrin results in samples MW3A121509, MW3C121509, MW4A121609, and MW4A121609D were qualified "J" or "UJ," as estimated concentrations due to potential low bias.

c. Calibration Verification (pp. PE103-PE105): The acceptance criteria of 15% difference was exceeded on both columns for methoxychlor, and on column 1 for alpha-BHC, gamma-BHC, heptachlor, endrin, 4,4'-DDD, 4,4'-DDT in the continuing calibration verification (CCV) standard analyzed at 19:36 on 12/16/09; and on column 1 for delta-BHC, aldrin, heptachlor epoxide, alpha chlordane, and gamma-chlordane in the CCV analyzed at 13:01 on 12/29/09. All positive and non-detect results associated with these non-conformances were qualified "J" or "UJ," as estimated concentrations, because of undetermined bias.

d. Dual Column RPDs (pp. PE111-PE112): The dual column RPD exceeded the 40% criteria for several compounds in samples MW4A121609 and MW4A121609D. Sample results less than the sample quantitation limit (SQL) with RPDs greater than 40%, but less than or equal to 50%, were qualified "J," as estimated; and results with RPDs greater than 50%, were qualified "U," as not detected at the sample quantitation limit. The results for heptachlor, endrin ketone, and endrin aldehyde in MW4A121609, and the results for heptachlor, endosulfan sulfate, and endrin aldehyde were negated on this basis; and the endrin ketone result in sample MW4A121609D was qualified "J," as an estimated concentration on this basis.

Results greater than or equal to the SQL with RPDs greater than 40%, but less than or equal to 70%, were qualified "J," as estimated; and results with RPDs greater than 70% were qualified "NJ,", as presumptively present at an estimated concentration. Note that Region 2 guidance states that in the absence of interference, results with RPDs greater than 100% should be rejected (qualified "R"). However, since interference was observed in all samples, no pesticide data were rejected on this basis. The beta-BHC and 4,4'-DDD results in MW4A121609, and the beta-BHC result in sample MW4A121609D were qualified "NJ," as presumptively present at an estimated concentration due to poor column precision.

AECOM049

a. Surrogate Recoveries (p. P3): The decachlorobiphenyl surrogate recoveries exceeded the upper quality control limit of 150% on column 2 for all samples except SB-5(52-54). The positive sample results for Aroclor 1254 in sample SB-17(1-2), Aroclors 1242 and 1254 in sample SB-7(6-8), and Aroclor 1242 in samples SB-8(2-3), SS-2, and SS-3 were qualified "J," as estimated concentrations, because of high bias attributable to matrix effects. No other results were qualified on this basis as they were either non-detect, or were reported from the compliant column.

b. Dilutions (Form 1s): SB-17(1-2) and SB-7(6-8) were analyzed at a secondary dilution to bring one or more target compounds into the calibration range. No data qualifications were required on this basis.

c. Interferences (Form 1s): Several samples contained multiple Aroclors and/or other non-target interferents which contained peaks that eluted in the range of other Aroclors that were reported as non-detects. Since it is possible that the presence of these interferents may mask low levels of the other Aroclors, the laboratory qualified many of these non-detects as estimated (UX). These results were qualified as estimated (UJ) to indicate that the reporting limit should be considered estimated.

AECOM050

a. Surrogate Recoveries (p. P3): The decachlorobiphenyl surrogate recoveries exceeded the upper quality control limit of 150% on column 2 for all samples in this data set, and on column 1 for for the undiluted analysis of sample SB-10(3-4), and the diluted and undiluted analyses of sample SB-9(4-5). In addition, the tetrachloro-m-xylene surrogate recoveries exceeded the upper quality control limit on column 2 for samples SB-18(4-5) and SB-14(1-2). All positive Aroclor results with the exception of Aroclor 1260 in sample SB-10(3-4) and Aroclor 1242 in sample SB-15(3-4) were qualified "J," as estimated concentrations, because of high bias attributable to matrix effects.

b. Calibration Verification (pp. P182-P191): The acceptance criteria of 15% difference was exceeded on column 2 for Aroclors 1016 and 1260 for the continuing calibration verification (CCV) standards analyzed at 12:47 and 16:30 on 10/5/09, and 12:38 and 18:46 on 10/12/09; the Aroclor 1016 CCV analyzed at 22:05 on 10/5/09; the Aroclor 1242 CCVs analyzed at 15:57 and 22:21 on 10/5/09; and the Aroclor 1254 CCVs analyzed at 13:20 and 22:38 on 10/5/09. All of the nonconformances indicated a potential high bias for results reported from column 2, which is consistent with the bias suggested by the surrogate results. All positive Aroclor results associated with these non-conformances were qualified "J," as estimated concentrations, because of high bias attributable to matrix effects.

c. Dilutions (Form 1s): SB-9(4-5), SB-10(3-4),SB-15(3-4), SB-16(2-3), and SB-18(4-5) were analyzed at a secondary dilution to bring one or more target compounds into the calibration range. No data qualifications were required on this basis.

d. Interferences (Form 1s): Several samples contained multiple Aroclors and/or other non-target interferents that contained peaks which eluted in the range of other Aroclors that were reported as non-detects. Since it is possible that the presence of these interferents may mask low levels of the other Aroclors, the laboratory qualified many of these non-detects as estimated (UX). These results were qualified as estimated (UJ) to indicate that the reporting limit should be considered estimated.

AECOM056

a. Surrogate Recoveries (p. P3): The decachlorobiphenyl surrogate recoveries exceeded the upper quality control limit of 150% on column 2 for samples SB-13(0-1), SB-2B(5), and SB-6(6). The positive sample results for Aroclor 1242 in sample SB-13(0-1), and Aroclor 1260 in sample SB-6(6) were qualified "J," as estimated concentrations, because of high bias attributable to matrix effects. No other results were qualified on this basis as they were either non-detect, or were reported from the compliant column.

b. Calibration Verification (pp. P76, P77, P79): The acceptance criteria of 15% difference was exceeded on both columns for Aroclors 1016 and 1260 for the CCV standards analyzed at 12:38 and 18:46 on 10/12/09 and the Aroclor 1242 CCV analyzed at 11:08 on 10/13/09. All of the nonconformances indicated a potential high bias for results reported from column 2, which is consistent with the bias suggested by the surrogate results. All positive Aroclor results associated with these non-conformances were qualified "J," as estimated concentrations, because of high bias attributable to matrix effects.

c. Interferences (Form 1s): Several samples contained multiple Aroclors and/or other non-target interferents which contained peaks that eluted in the range of other Aroclors that were reported as non-detects. Since it is possible that the presence of these interferents may mask low levels of the other Aroclors, the laboratory qualified many of these non-detects as estimated (UX). These results were qualified as estimated (UJ) to indicate that the reporting limit should be considered estimated.

AECOM049

a. Calibration Verifications (pp. H153-154): The acceptance criteria of 15% difference was exceeded on both columns for the compounds 2,4-D, 2,4,5-T and 2,4-DB, and one column 2 for 2,4,5-TP (Silvex) in the continuing calibration standard analyzed at 14:51 on 10/19/09. All positive and non-detect results for 2,4-D, 2,4,5-T and 2,4-DB in samples SB-7(6-8) and SB-8(2-3) were qualified "J," or "UJ," respectively, due to a potential low bias. No 2,4,5-TP (Silvex) results were qualified as they were non-detect in the associated samples and the nonconformance affected only one column.

b. Dual Column RPDs (pp. H165, H168, H171-H173): The dual column RPD exceeded the 40% criteria in several samples. Results with RPDs greater than 40%, but less than or equal to 50%, were qualified "J," as estimated; results with RPDs greater than 50%, but less than or equal to 90% were qualified "JN,", as presumptively present at an estimated concentration; and results with RPDs greater than 90% were rejected (i.e., qualified "R"). Therefore the 2,4-D result in SS-5 was qualified "JN"; the 2,4-DB results in SB-17(1-2) was qualified "J"; the 2,4-DB result in SB-5(52-54) was rejected; the 2,4,5-T result was qualified "J" and the 2,4-DB result was qualified "JN" in sample SB-8(2-3); and the 2,4-D and 2,4-DB results in SB-7(6-8) were rejected. Note that multiple non-target interferents were observed in these samples and are likely the cause of the poor agreement between columns. In all cases, the laboratory reported the lower value in accordance with Region 2 guidance.

AECOM058

a. Surrogate Recoveries (p. H4): The recovery of the surrogate compound DCAA exceeded the upper quality control limit on column 1, and was not detected on column 2 in the analysis of SB-3(36-38). Significant interference was observed on column 2, masking the surrogate response and preventing accurate quantitation. Therefore, professional judgment was used to qualify the non-detect results as estimated "UJ", rather than to reject them as would normally be done in the case of recovery less than 10%.

b. Dual Column RPDs (p. H130): The dual column RPD for 2,4-DB in SB-17(40-42) was 152%. This result was rejected (i.e., qualified "R").

AECOM063

a. Dual Column RPDs (pp. H81-H82): The dual column RPD exceeded the 40% criteria in samples MW4A121609 and MW4A121609D. Results with RPDs greater than 40%, but less than or equal to 50%, were qualified "J," as estimated; results with RPDs greater than 50%, but less than or equal to 90% were qualified "JN,", as presumptively present at an estimated concentration; and results with RPDs greater than 90% were rejected (qualified "R"). Therefore the 2,4-DB result in MW4A121609 was rejected; the 2,4-D result was qualified "J" and the 2,4-DB result was qualified "JN" in sample MW4A121609D. Note that multiple non-target interferents were observed in these samples and are likely the cause of the poor agreement between columns. In all cases, the laboratory reported the lower value in accordance with Region 2 guidance.

a. Contract Required Detection Limit (CRDL) Standard Recoveries (pp. M32-M33): The low level check standard recovery for lead was less than the lower quality control limit (QC limits 80-120%). The positive and non-detect lead results for associated samples SB-5 (28-30) and RB100509 were qualified "J and UJ," as estimated concentrations because of low method bias.

b. Matrix Spike Recoveries (pp. M43-M44): Sample SB-3 (4-5) was designated in the field to be processed as the MS sample. The silver MS recovery was less than the lower advisory limit (limits of 75-125%). The positive and non-detect silver results in samples SS-3, SS-4, SS-5, DUP-1, SB-3 (4-5), SB-17 (1-2), SS-2, SB-5 (16-18), SB-5 (28-30), SB-5 (52-54), SB-8 (2-3), and SB-7 (6-8) were qualified "J and UJ" as estimated concentrations because of low bias attributable to matrix effects.

   The SB-3 (4-5) MS recovery for mercury was greater than the upper advisory limit (limits of 75-125%). The positive mercury results in samples SS-3, SS-4, SS-5, DUP-1, SB-3 (4-5), SB-17 (1-2), SS-2, SB-5 (16-18), SB-8 (2-3), and SB-7 (6-8) were qualified "J" as estimated concentrations because of high bias attributable to matrix effects.

   The SB-3 (4-5) MS and post-digestion spike recoveries for copper were less than the lower advisory limit for the MS and greater than the upper advisory limit for the post-digestion spike (limits of 75-125%). The positive copper results in samples SS-3, SS-4, SS-5, DUP-1, SB-3 (4-5), SB-17 (1-2), SS-2, SB-5 (16-18), SB-5 (28-30), SB-5 (52-54), SB-8 (2-3), and SB-7 (6-8) were qualified "J" as estimated concentrations because of conflicting low and high bias attributable to matrix effects.

c. Serial Dilution Percent Difference (%D) (p. M50): Serial dilution analysis was performed on sample SB-3 (4-5). Calcium, chromium, lead, magnesium, manganese, nickel, vanadium, and zinc did not meet QC limits of <10%D in this sample. The positive calcium, chromium, lead, magnesium, manganese, nickel, vanadium, and zinc results in samples SS-3, SS-4, SS-5, DUP-1, SB-3 (4-5), SB-17 (1-2), SS-2, SB-5 (16-18), SB-5 (28-30), SB-5 (52-54), SB-8 (2-3), and SB-7 (6-8) were qualified "J," as estimated concentrations.

b. Matrix Spike Recoveries (p. M55): Sample TP-3 (7.5) was designated in the field to be processed as the MS sample. The antimony, silver, and thallium MS recoveries were less than the lower advisory limit (limits of 75-125%). The positive and non-detect antimony, silver, and thallium results in samples SB-15 (3-4), SB-16 (2-3), SB-18 (4-5), SB-9 (4-5), SB-9 (20-21.5), SB-9 (36-38), SB-9 (40-42), SB-10 (3-4), SB-10 (48-50), SB-13 (18-24), SB-14 (1-2), SB-14B (11-13), SB-4 (1-2), SB-10 (16-18), SB-10 (40-41.5), SB-12 (4-5), DUP-2, TP-3 (7.0), and TP-3 (7.5) were qualified "J and UJ" as estimated concentrations because of low bias attributable to matrix effects.

   The TP-3 (7.5) MS recovery for mercury was greater than the upper advisory limit (limits of 75-125%). The positive mercury results in samples SB-15 (3-4), SB-16 (2-3), SB-18 (4-5), SB-9 (4-5), SB-10 (3-

c. Laboratory Duplicate RPDs (p. M57): Sample TP-3 (7.5) was designated in the field to be processed as the laboratory duplicate sample. The iron laboratory duplicate RPD exceeded the RPD criterion of 35%. The positive iron results in samples SB-15 (3-4), SB-16 (2-3), SB-18 (4-5), SB-9 (4-5), SB-9 (20-21.5), SB-9 (36-38), SB-9 (40-42), SB-10 (3-4), SB-10 (48-50), SB-13 (18-24), SB-14 (1-2), SB-14B (11-13), SB-4 (1-2), SB-10 (16-18), SB-10 (40-41.5), SB-12 (4-5), DUP-2, TP-3 (7.0), and TP-3 (7.5) were qualified "J" as estimated concentrations, because of imprecision, attributable to matrix effects and/or sample heterogeneity.

d. Serial Dilution Percent Difference (%D) (p. M62): Serial dilution analysis was performed on sample TP-3 (7.5). Cobalt and zinc did not meet QC limits of <10%D in this sample. The positive cobalt and zinc results in samples SB-15 (3-4), SB-16 (2-3), SB-18 (4-5), SB-9 (4-5), SB-9 (20-21.5), SB-9 (36-38), SB-9 (40-42), SB-10 (3-4), SB-10 (48-50), SB-13 (18-24), SB-14 (1-2), SB-14B (11-13), SB-4 (1-2), SB-10 (16-18), SB-10 (40-41.5), SB-12 (4-5), DUP-2, TP-3 (7.0), and TP-3 (7.5) were qualified "J," as estimated concentrations.

e. a. Contract Required Detection Limit (CRDL) Standard Recoveries (p. M16): The low level check standard recovery for selenium was less than the lower quality control limit (QC limits 80-120%). The non-detect selenium result for associated sample GW-1 was qualified "J," as an estimated concentration because of low method bias.

b. Matrix Spike Recoveries (p. M25): Sample GW-1 was designated as the MS sample. The antimony and silver MS recoveries were less than the lower advisory limit (limits of 75-125%). The positive antimony and silver results in GW-1 were qualified "J" as estimated concentrations because of low bias attributable to matrix effects.

The GW-1 MS recovery for mercury was greater than the upper QC limit (QC limits of 75-125%). The positive mercury result in GW-1 was qualified "J" as an estimated concentration because of high bias attributable to matrix effects.

c. Serial Dilution Percent Difference (%D) (p. M32): Serial dilution analysis was performed on sample GW-1. Chromium, cobalt, lead, magnesium, manganese, nickel, and zinc did not meet QC limits of <10%D in this sample. The positive chromium, cobalt, lead, magnesium, manganese, nickel, and zinc results in sample GW-1 were qualified "J," as estimated concentrations.

a. Contract Required Detection Limit (CRDL) Standard Recoveries (p. M34): The low level check standard recovery for lead was less than the lower quality control limit (QC limits 80-120%). The positive and non-detect lead result for associated samples SB-11 (32-32.5) and RB2-101309 were qualified "J and UJ," as estimated concentrations because of low method bias.

b. Matrix Spike Recoveries (pp. M41-M42): Sample TP-1 (9) was designated in the field to be processed as the MS sample. The antimony, selenium, and silver MS recoveries were less than the lower advisory limit (limits of 75-125%R). a. Contract Required Detection Limit (CRDL) Standard Recoveries (p. M34): The low level check standard recovery for selenium was greater than the upper quality control limit (QC limits 80-120%). The positive selenium results for associated samples TP-1(12), SB-2B (37-38), SB-1(5), SB-14B (20-22), and SB-6(16-18) were qualified "J," as estimated concentrations because of high method bias.

b. Matrix Spike Recoveries (p. M43): Sample SB-4 (36-38) was designated as the MS sample. The antimony MS recovery was less than the lower advisory limit (limits of 75-125%). The positive and non-detect antimony results in samples SB-4 (36-38), SB-4 (44-46), TP-1 (12), SB-2B (14-16), SB-2B (37-38), SB-2B (42-44), SB-1(5), SB-14B (20-22), SB-14B (38-40), SB-14B (54-56), SB-16B (30-32), SB-16B (44-46), SB-6 (16-18), SB-6 (26-28), SB-6 (30-32), SB-12B (40-42), and SB-12B (48-50) were qualified "J and UJ" as estimated concentrations because of low bias attributable to matrix effects.

c. Percent Solids (Form 1s): Sample SB-14B (20-22) had percent solids <50%. All metals in sample SB-14B (20-22) were qualified "J and UJ", as estimated concentrations attributable to sample heterogeneity.

AECOM058

a. Contract Required Detection Limit (CRDL) Standard Recoveries (p. The positive and nondetect antimony and selenium results in samples SB-1C (23-25), SB-1C (80-81.5), SB-1C DUP01 (112009), and SB-1C (98-100) were qualified "J and UJ" as estimated concentrations because of low bias attributable to matrix effects.

   The SB-1C (23-25) MS recovery for manganese was greater than the upper advisory limit (limits of 75-125%R). The positive manganese results in samples SB-1C (23-25), SB-1C (80-81.5), SB-1C DUP01 (112009), and SB-1C (98-100) were qualified "J" as estimated concentrations because of high bias attributable to matrix effects.

AECOM063

a. Matrix Spike Recoveries (p. M34): Sample MW3A121509 was designated in the field to be processed as the MS sample. The selenium recovery was greater than the upper advisory limit (limits of 75-125%). The positive selenium results in samples MW1A121409, MW1C121409, and MW4A121609 were qualified "J" as estimated concentrations because of high bias attributable to matrix effects.

b. Serial Dilution Percent Difference (%D) (p. M39): Serial dilution analysis was performed on sample MW3A121509. Potassium did not meet QC limits of <10%D in this sample. 8.0 Total and Free Cyanide

AECOM049

No data quality issues were noted. No data qualifications were required.

AECOM050

Dilutions and Reporting Limits: Samples SB-9 (4-5), SB-14 (1-2), and SB-18 (4-5) required analysis at an initial dilution to minimize matrix interference. The dilutions elevated the detection and quantitation limits.

Sample SB-13 (18-25) required analysis at a dilution to bring the free cyanide concentration into the calibration range. No data qualification was required.

AECOM051

No data quality issues were noted. No data qualifications were required.

AECOM056

Data Reporting (p. W24): Sample SB-13 (12-14) required analysis at a five-fold dilution to bring the free cyanide concentration into the calibration range and/minimize matrix interference. There was an error when the analyst manually entered the dilution factor and it overwrote the result by changing the dilution adjusted PQL. The effect was that a non-detect result was reported in error. The data report page was revised.

AECOM057

a. Contract Required Detection Limit (CRDL) Standard Recoveries (p. W25): The low level check standard recovery for free cyanide was less than the lower quality control limit (QC limits 70-130%). The free cyanide results for associated samples SB-4 (36-38), SB-4 (44-46), SB-2B (14-16), SB-2B (37-38), and SB-2B (42-44) were non-detect and were qualified "UJ," as estimates because of low method bias.

b. Percent Solids (Form 1s): Sample SB-14B (20-22) had percent solids <50%. The non-detect free cyanide result for sample SB-14B (20-22) was qualified UJ," as an estimate attributable to sample heterogeneity.

AECOM058

No data quality issues were noted. No data qualifications were required.

AECOM062

No data quality issues were noted. No data qualifications were required.

AECOM063

No data quality issues were noted. No data qualifications were required.

AECOM064

Contract Required Detection Limit (CRDL) Standard Recoveries (pp. M41, M81, M281): The low level check standard recovery for total cyanide was greater than the upper quality control limit (QC limits 70-130%). The

positive total cyanide result for associated sample MW2B121609 was qualified “J,” as an estimated concentration, because of high method bias.

9.0 Field Duplicate Comparisons

The samples listed in the table below were the parent and field duplicate samples collected for this sampling event.

Parent	Field Duplicate	Matrix
SS-2	DUP-1	Soil
TP-3 (7.0)	DUP-2	Soil
TP-1 (12)	DUP-3	Soil
SB-1C (80-81.5)	SB-1C DUP01 (112009)	Soil
MW4A121609	MW4A121609D	Groundwater
MW4C121509	MW4C121509D	Groundwater

Field duplicate results were evaluated using the following criteria.

Organics: The RPD must be ≤ 50% for soil/sediments and ≤ 30% for groundwater samples or the difference between the parent and field duplicate results must be less than the reporting limit for results less than five times the reporting limit.

Inorganics: The RPD must be ≤ 35% for soil/sediments and ≤ 20% for groundwater samples or the difference between the parent and field duplicate results must be less than twice the reporting limit for results less than five times the reporting limit.

The results for the parent and field duplicate samples were non-detects, with exception to those listed in Tables 2A through 2F below. All RPDs were less than the maximum advisory limits or the difference criteria were met for all analytes/compunds except for those results listed below in bolded text. The bolded results were qualified "J/UJ," as estimates because of laboratory/field sampling imprecision and/or sample heterogeneity.

The following notations are used in the field precision tables.

RPD: Relative percent difference

NC: RPD could not be calculated

*: The difference between the parent and field duplicate results was less than the reporting limit (twice the reporting limit for metals) for results less than five times the reporting limit. Variation of this magnitude is acceptable.

10.0 Notes

Positive organic results less than the reporting limit, but greater than the method detection limit (MDL) were qualified “J,” as estimated concentrations, due to increased uncertainty near the detection limit. The “J” qualifiers were maintained in the data validation.

Positive inorganic results less than the reporting limit, but greater than the MDL were flagged with a “B,” to indicate an estimated concentration, due to increased uncertainty near the detection limit. The “B” flags were changed to “J” qualifiers by the validator.

Matrix spike and matrix spike duplicates, laboratory duplicates, and ICP serial dilutions that were performed on non-project samples were not evaluated because matrix similarity to project samples could not be assumed.

Glossary of Data Qualifier Codes

Glossary of Data Qualifier Codes

U The analyte was analyzed for, but was not detected above the level of the reported sample quantitation limit.

UJ The analyte was analyzed for, but was not detected. The reported quantitation limit is approximated and may be inaccurate or imprecise.

J The analyte was positively identified. The associated numerical value is the approximate concentration of the analyte in the sample.

R The data are unusable. The sample results are rejected due to serious deficiencies in the ability to meet quality control criteria. The presence or absence of the analyte cannot be verified.

N (Organics) The analysis indicates the presence of an analyte for which there is presumptive evidence to make a tentative identification.

NJ (Organics) The analysis indicates the presence of an analyte that has been tentatively identified and the associated numerical value represents its approximate concentration.
